

**Fig 3.** Cross section of wheels on tracks and pipe encompassing Fiber Cables located between tracks

For both situations of existing or new rails networks, the cost of establishing such fiber optic networks along railway tracks is noticeably low compared to digging fresh tunnels to house ground cables. Existing Railways infrastructure such as control rooms can be used to house repeater equipment for cables, and supply power can be extended from existing power network that is supplying railways stations. Repeaters will be required for distance over 100Km, to compensate for attenuation caused by cables. Fiber optic communication network can be utilized in supplying network connectivity to stations, staff, IT infrastructure, and onboard train cars for public transportation travelers.

**Fig 4.** Cross section of wheels on tracks and pipe encompassing Fiber Cables located between tracks

Additionally, laying such cable network would constitute addition revenue source for railways authorities as it can be leased to investors in the communication business. Furthermore, and as in US, railways companies have jumped into the business of supplying connection services to communities for even bigger profits[6]. A good example of this is The Florida East Coast Railroad had been collecting rent from giant telecommunications companies that had buried cable beside its tracks. But between 1999-2000 the company decided to jump directly into the market of selling transmission capacity to telephone companies, wireless services and Internet service providers. The Epix's network covers 80 percent of Florida's population and extends west to Texas and north to Atlanta for revenue in the range of \$60 million.

#### **IV. Conclusions**

A proposal of establishing fiber optic cable network leveraging existing infrastructure of railways network is presented. The proposal is suitable for countries with existing or to be constructed new rails networks, such as in Africa where many countries have extensive railways networks that cover vast sections of country lands. Such networks provide cost effective method of connecting remote cities and towns in these countries who rely solely on cellular phone service for communications. Cost of establishing fiber-optic cable networks laid over existing, with planned new railways, or renewed railways tracks appears to be lower in cost when compared to regular ground cable networks.
