Beyond Programming Bruce I. Blum, 1996-01-11 This book provides a unique examination of the software development process arguing that discipline still dominated by methods conceived in the framework of older technologies must undergo a fundamental reexamination of its guiding principles in order for significant progress to take place To gain fresh insights into how we ought to direct future research the author begins with a search for first principles The book begins with an exploration of the scientific foundations of computer technology then examines design from the perspective of practitioners The book also offers a critique of the methods employed in software development and an evaluation of an alternate paradigm that has been used successfully for 14 years The concepts reviewed here comprise a set of core readings for understanding

Technical Abstract Bulletin , 1980 [Spacecraft Dynamics and Control](#) Enrico Canuto, Carlo Novara, Donato Carlucci, Carlos Perez-Montenegro, Luca Massotti, 2018-03-08 Spacecraft Dynamics and Control The Embedded Model Control Approach provides a uniform and systematic way of approaching space engineering control problems from the standpoint of model based control using state space equations as the key paradigm for simulation design and implementation The book

introduces the Embedded Model Control methodology for the design and implementation of attitude and orbit control systems. The logic architecture is organized around the embedded model of the spacecraft and its surrounding environment. The model is compelled to include disturbance dynamics as a repository of the uncertainty that the control law must reject to meet attitude and orbit requirements within the uncertainty class. The source of the real time uncertainty estimation prediction is the model error signal as it encodes the residual discrepancies between spacecraft measurements and model output. The embedded model and the uncertainty estimation feedback noise estimator in the book constitute the state predictor feeding the control law. Asymptotic pole placement exploiting the asymptotes of closed loop transfer functions is the way to design and tune feedback loops around the embedded model state predictor control law reference generator. The design versus the uncertainty class is driven by analytic stability and performance inequalities. The method is applied to several attitude and orbit control problems. The book begins with an extensive introduction to attitude geometry and algebra and ends with the core themes state space dynamics and Embedded Model Control. Fundamentals of orbit attitude and environment dynamics are treated giving emphasis to state space formulation disturbance dynamics state feedback and prediction closed loop stability. Sensors and actuators are treated giving emphasis to their dynamics and modelling of measurement errors. Numerical tables are included and their data employed for numerical simulations. Orbit and attitude control problems of the European GOCE mission are the inspiration of numerical exercises and simulations. The suite of the attitude control modes of a GOCE like mission is designed and simulated around the so called mission state predictor. Solved and unsolved exercises are included within the text and not separated at the end of chapters for better understanding training and application. Simulated results and their graphical plots are developed through MATLAB Simulink code.
