Seaside Operations Planning in Container Terminals Frank Meisel, 2009-05-28 1 1 Motivation and Scope of Research Container terminals in seaports constitute interfaces between sea and land transport of goods in global transport chains These logistics facilities face an increasing demand of service capacity as is reflected by a tremendous growth in the worldwide container transshipments per year For example the top 20 terminals in the world showed an average relative increase of 14% with respect to the number of handled container units from 2006 to 2007 see Port of Hamburg Marketing 2008 In spite of this development competition is high among container terminals within the same region A terminal's customers first and foremost the vessel operators expect a high level of service quality where reliability is one of the most important dimensions see Wiegman et al 2001 Regarding the service of a vessel reliability means to realize all transshipment operations within its projected service time interval The reliability of terminal operations impacts the reliability of vessels in meeting their liner schedules According to Notteboom 2006 unexpected waiting times of vessels before berthing and unexpected low transshipment productivity at terminals are responsible for about 86% of liner schedule disturbances see Fig 1 1 Currently many terminal operators counteract this situation by extending their transshipment capacities They build new terminals or enlarge existing terminals and purchase new or upgrade existing equipment Ilmer 2005 provides an overview of current projects for building terminal capacity in northern Europe
