Flashback Mechanisms in Lean Premixed Gas Turbine

Combustion Ali Cemal Benim, Khawar Jamil Syed, 2014-12-01 Blending fuels with hydrogen offers the potential to reduce NO_x and CO₂ emissions in gas turbines but doing so introduces potential new problems such as flashback. Flashback can lead to thermal overload and destruction of hardware in the turbine engine with potentially expensive consequences. The little research on flashback that is available is fragmented. **Flashback Mechanisms in Lean Premixed Gas Turbine Combustion** by Ali Cemal Benim will address not only the overall issue of the flashback phenomenon but also the issue of fragmented and incomplete research. Presents a coherent review of flame flashback, a classic problem in premixed combustion and its connection with the growing trend of popularity of more efficient hydrogen blend fuels. Begins with a brief review of industrial gas turbine combustion technology. Covers current environmental and economic motivations for replacing natural gas with hydrogen blend fuels.

Gas Turbine Engineering Handbook

Meherwan P. Boyce, 2002 The gas turbine is a power plant which produces a great amount of energy for its size and weight. This is a comprehensive treatment of gas turbines. The author discusses the design, fabrication, installation, operation, and maintenance of gas turbines. He presents the necessary data along with suggestions to assist engineers in obtaining optimum performance for any gas turbine under all conditions. The intent of the work is to serve as a reference text after it has accomplished its primary objective of introducing the reader to the broad subject of gas turbines.

Gas Turbine Fuels and Their Influence on Combustion

J. Odgers, D. Kretschmer, 1986. Filmed work by students of the School of Design, Swinburne University of Technology. Approaches for Clean Combustion in Gas Turbines Medhat A. Nemitallah, Ahmed A. Abdelhafez, Mohamed A. Habib, 2020-03-24 This book focuses on the development of novel combustion approaches and burner designs for clean power generation in gas turbines. It shows the reader how to control the release of pollutants to the environment in an effort to reduce global warming. After an introduction to global warming issues and clean power production for gas turbine applications, subsequent chapters address premixed combustion burner designs for clean power generation, gas turbine performance, and insights on gas turbine operability. Given its scope, the book can be used as a textbook for graduate level courses on clean combustion or as a reference book to accompany compact courses for mechanical engineers and young researchers around the world.

Flow and Combustion in Advanced Gas Turbine Combustors Johannes Janicka, AMSINI SADIKI, Michael Schäfer, Christof Heeger, 2012-10-29 With regard to both the environmental sustainability and operating efficiency demands, modern combustion research has to face two main objectives: the optimization of combustion efficiency and the reduction of pollutants. This book reports on the combustion research activities carried out within the Collaborative Research Center SFB 568 Flow and Combustion in Future Gas Turbine Combustion Chambers, funded by the German Research Foundation DFG. This aimed at designing a completely integrated modeling and numerical simulation of the occurring very complex coupled and interacting physico-chemical processes such as turbulent heat and mass transport, single or multi-phase flows.

Gas Turbine Theory H. I. H. Saravanamuttoo, 2009 In recent years the gas turbine in combination with the steam turbine has played an ever increasing role in power generation Despite the rapid advances in both output and efficiency the basic theory of the gas turbine has remained unchanged The layout of this new edition is broadly similar to the original but greatly expanded and updated comprising an outline of the basic theory aerodynamic design of individual components and the prediction of off design performance The addition of a chapter devoted to the mechanical design of gas turbines greatly enhances the scope of the book Publisher's website

Combustion and Fuels in Gas Turbine Engines ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT NEUILLY-SUR-SEINE (France), 1988 The design of gas turbine combustion chambers is becoming increasingly more sophisticated as demands on performance increase and combustor operating conditions become more and more harsh The design compromises which account for much of the art in successful combustor design have become more difficult as gas turbine cycles reach higher pressure and temperature levels and design objectives become more rigorous This is particularly true for military applications of gas turbines for both manned and unmanned aircraft Concurrently there is significant pressure for the combustor designer to reduce development time and cost reduce life cycle costs increase fuel tolerance and continue to minimize the environmental impact of the combustion process In the past two decades an increasing amount of fundamental knowledge of chemical aerodynamic and thermal phenomena plus a more detailed understanding of sprays has been applied with considerable success to practical combustor design The papers presented at this symposium Combustion and Fuels in Gas Turbine Engines are categorized under the following four subject headings Alternative Fuels and Fuel Injection Combustor Development Soot and Radiation and Combustion Modeling Keywords NATO furnished After burners Alternative fuels Atomization drops Distribution Soot

Combustion and Heat Transfer in Gas Turbine Systems E. R. Norster, 2013-10-22 Combustion and Heat Transfer in Gas Turbine Systems is a compilation of papers from the Proceedings of an International Propulsion Symposium held at the College of Aeronautics Cranfield in April 1969 This compilation deals with research done by academic and scientific institutions and of industrial organizations with some research papers covering atomization fuels and high temperature materials One paper describes the combustion system of the Concorde engine used in commercial flights temperature of metal parts and some design modifications to increase the mechanical life of the combustion system Another paper discusses the evolution of the RB 162 combustion system that is used in the vertical takeoff and landing aircrafts The RB 162 has many design features of the earlier single reversal chamber and differs in only one or two points The book then notes the necessity of a plenum chamber burning to further development of supersonic engines and flight One paper also proposes an alternative theory to the traditional ignition theory of altitude relighting such as those developed by Lewis and von Elbe Another paper reports on some observations made of the atomizing characteristics of air blast atomizers and proposes simple changes to

improve the performance of the atomizer by prefilming and allowing air to both sides of the fuel This compilation will prove very helpful for aeronautical engineers aviation designers physicists students of engineering and readers who are interested in the design and development of jet engines and supersonic aircrafts The Aerothermodynamics of Aircraft Gas Turbine Engines Gordon C.
