Abstract: Despite very strict wildlife protection acts in several countries and trading laws such as CITES, illegal trading and poaching of wildlife is still active mostly because of the use of their parts in Chinese medicinal products and ornaments. For successfully identifying wildlife and their parts, mitochondrial DNA sequencing is being used now-a-days. DNA bar coding using fragments of cytochrome b and cytochrome oxidase I genes are frequently utilized for mammalian species identification. This mini review describes some of the mtDNA sequences and STR markers used for mammalian species identification in the field of forensic wildlife along with the problems associated and their possible solutions.

Keywords: Cytochrome b, cytochrome oxidase, DNA bar coding, wildlife forensics.

INTRODUCTION

Earth is losing wildlife at an alarming rate and only few new species are being discovered each year. Illegal trade of wildlife parts and their products is worth more than 20 billion per year in black market [1]. In Nepal, every year millions worth of animal parts such as ivory, tiger skin and bone, bear bile, rhino horn and other wildlife materials are illegally transported across the borders mostly via Tibet. This kind of illegal trade creates a serious threat to the global as well as to the local diversity either directly or indirectly. Consequently the role of international organizations such as WWF (World Wildlife Fund), IUCN (International Union for Conservation of Nature) and CITES (Convention on International Trade in Endangered Species of Wild Flora and Fauna) becomes more valuable than ever in protecting wildlife and their habitat. Habitat destruction causes increase of wildlife poaching due to their ever increasing vulnerability of being caught by humans, so that wildlife trade should also be cautiously examined and monitored for any critical illegal transactions [2].

WILDLIFE CONSERVATION

CITES regulates the global trade of wildlife within its 180 signatory countries [3]. It operates by listing wildlife (approximately 5,600 animal and 30,000 plant species are currently listed by CITES) in one of its three appendices (Appendix I, II and III). Since it is a trading treaty, it allows free and controlled trade of wildlife parts and their products from non-endangered wildlife (flora and fauna both), whose survival is not yet threatened but the species registered in Appendix I (630 fauna and 301 flora) [3] are banned from such trade, except for scientific research and other specific purposes. Although CITES is legally binding to the signatory

countries, it does not replace national laws. Problems arise when species of CITES appendix I cannot be verified by the laboratory when confiscated and sent for identification by the forest officers. Most of the time, domestic animal parts are confused with parts from protected and endangered animal species, as it is difficult to identify them through morphological and anatomical studies only. The difficulties that arise after the capture of wildlife parts or their products are: (i) determining the species that was killed with the help of a bloodstain only, (ii) when the sample is in altered or powdered form, (iii) identification up to family of animal but not to the specific species, and (iv) sometimes not even a clue, regarding the wildlife from which the sample originated, can be deciphered from basic morphological or anatomical test procedure [4].

Species identification becomes more problematic because most of the times it's not the whole animal part but rather only a small piece or some modified part such as musk cone, rhino-ceros horn, elephant ivory, elephant tail hair, tiger skin and bone that is traded [1]. This leads to complexity in precisely identifying the concerned protected wildlife species. The suspected animal is then either excluded or not excluded or a family of the animal is discerned for the species but not the species itself. This limitation can be remedied by using molecular tools and techniques for wildlife parts and product identification. Newer techniques such as DNA sequencing can help in identifying the species from which the product originated with great accuracy and reliability.

SPECIES IDENTIFICATION

For the purpose of species identification, although for most of the intact specimens the morphological observations may be enough, but in samples which contain only some part of an animal or their modified products (e.g. powder), DNA based methods are the methods of choice. In the text that follows, we first describe the limitations of conventional
