*Stratigraphic Reservoir Characterization for Petroleum Geologists, Geophysicists, and Engineers* Roger M.

Slatt, 2013-11-21 Reservoir characterization as a discipline grew out of the recognition that more oil and gas could be extracted from reservoirs if the geology of the reservoir was understood Prior to that awakening reservoir development and production were the realm of the petroleum engineer In fact geologists of that time would have felt slighted if asked by corporate management to move from an exciting exploration assignment to a more mundane assignment working with an engineer to improve a reservoir's performance Slowly reservoir characterization came into its own as a quantitative multidisciplinary endeavor requiring a vast array of skills and knowledge sets Perhaps the biggest attractor to becoming a reservoir geologist was the advent of fast computing followed by visualization programs and theaters all of which allow young geoscientists to practice their computing skills in a highly technical work environment Also the discipline grew in parallel with the evolution of data integration and the advent of asset teams in the petroleum industry Finally reservoir characterization flourished with the quantum improvements that have occurred in geophysical acquisition and processing techniques and that allow geophysicists to image internal reservoir complexities Practical resource describing different types of sandstone and shale reservoirs Case histories of reservoir studies for easy comparison Applications of standard new and

emerging technologies      *DEVELOPMENT OF RESERVOIR CHARACTERIZATION TECHNIQUES AND PRODUCTION MODELS FOR EXPLOITING NATURALLY FRACTURED RESERVOIRS.* ,2002 For many years geoscientists and engineers have undertaken research to characterize naturally fractured reservoirs Geoscientists have focused on understanding the process of fracturing and the subsequent measurement and description of fracture characteristics Engineers have concentrated on the fluid flow behavior in the fracture porous media system and the development of models to predict the hydrocarbon production from these complex systems This research attempts to integrate these two complementary views to develop a quantitative reservoir characterization methodology and flow performance model for naturally fractured reservoirs The research has focused on estimating naturally fractured reservoir properties from seismic data predicting fracture characteristics from well logs and developing a naturally fractured reservoir simulator It is important to develop techniques that can be applied to estimate the important parameters in predicting the performance of naturally fractured reservoirs This project proposes a method to relate seismic properties to the elastic compliance and permeability of the reservoir based upon a sugar cube model In addition methods are presented to use conventional well logs to estimate localized fracture information for reservoir characterization purposes The ability to estimate fracture information from conventional well logs is very important in older wells where data are often limited Finally a desktop naturally fractured reservoir simulator has been developed for the purpose of predicting the performance of these complex reservoirs The simulator incorporates vertical and horizontal wellbore models methods to handle matrix to fracture fluid transfer and fracture permeability tensors This research project has developed methods to characterize and study the performance of naturally fractured reservoirs that integrate geoscience and engineering data This is an important step in developing exploitation strategies for optimizing the recovery from naturally fractured reservoir systems The next logical extension of this work is to apply the proposed methods to an actual field case study to provide information for verification and modification of the techniques and simulator This report provides the details of the proposed techniques and summarizes the activities undertaken during the course of this project Technology transfer activities were highlighted by a two day technical conference held in Oklahoma City in June 2002 This conference attracted over 90 participants and included the presentation of seventeen technical papers from researchers throughout the United States      **Development Theories and Methods of Fracture-Vug Carbonate Reservoirs** Yang Li,2017-05-17 Development Theories and Methods of Fracture Vug Carbonate Reservoirs explores the theories and methods for successful development of a fracture vug reservoir by presenting the developmental strategies used in the Tahe oilfield Some of the theories and methods of developing the Tahe fracture vug reservoirs have been inspired by two China national research projects The Basic research on development of fracture vug carbonate reservoirs 2006 2010 and the Basic research on production mechanism and oil recovery enhancement of fracture vugcarbonate reservoirs 2011 2015 with support by the National Basic Research Program of China These theories and methods have facilitated the successful development of the
