

Flow Calculation for Gases

The calculation of flow (Cv) is a formula which is used to determine a valve's flow under various conditions and to select the correct valve for a flow application. The Cv was designed to deal with liquid flows. It expresses the flow in gallons per minute at 60° F under one pound drop across the valve at 1 psi. However, this same Cv value can be used to determine gas flow through a valve. The formula however does indicate the gases, as gases are compressible fluids and are thus affected by temperature. Furthermore, gas formulas are required to accurately estimate flow. When the appropriate pressure equals or exceeds one pound the downstream pressure, it is known as a "choked flow" condition. This calls for use of the Critical Flow Formula. If the appropriate pressure is less than one pound the downstream pressure, the Isenthalpic Flow Formula should be used.

Critical Flow When: $P_2 \geq 2 \times P_1$	Isal + Critical Flow When: $P_2 < 2 \times P_1$
$C_v = Q_g \frac{\sqrt{S.G. \times T}}{816 \times P_1}$	$C_v = \frac{Q_g}{962} \sqrt{\frac{(S.G. \times T)}{(P_1^2 - P_2^2)}}$
$Q_g = C_v \frac{816 \times P_1}{\sqrt{S.G. \times T}}$	$Q_g = 962 \times C_v \sqrt{\frac{(P_1^2 - P_2^2)}{(S.G. \times T)}}$

where:

Q_g = Gas Flow in thousands of cubic feet per hour

P_1 = Upstream static pressure in psi

T = Absolute temperature in °R, °F + 460

P_2 = Downstream static pressure in psi

P_1 = Absolute pressure. This is only large pressure plus 14.7 (atmospheric pressure)

$S.G.$ = Specific Gravity of medium where air at 60° F and 14.7 psi = 1.0

Example:

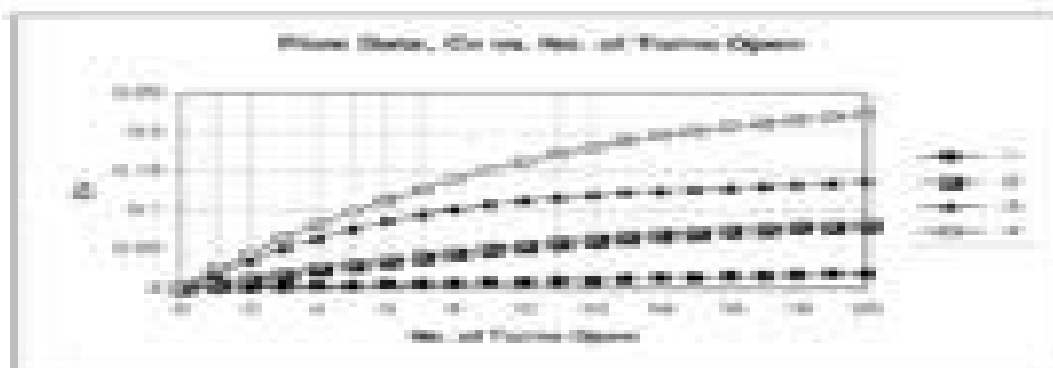

Estimate which valve size should be used for the following application. Upstream pressure is 100 psig, downstream is atmosphere. The medium is 60° F wettest gas (S.G. = .704) and the desired flow range is up to 600 SCFH.

$$C_v = \frac{600}{816} \times \frac{\sqrt{.704 \times 560}}{\sqrt{100 - 0}} = 10.98$$

The Cv value at which 600 SCFH of medium will flow under the above conditions is 10.98. Upon examination of our Cv table the pressure drop, we note that this value is reached at approximately size 6.3 with over 3

100% wettest gas at 60° F with over 400 SCFH wettest. This and most other valves become approximately 1.4 or 1.3 times all wettest providing for this application.

Quantitative Gas Chromatography for Laboratory Analyses and On-Line Process Control G. Guiochon, C.L. Guillemin, 1988-06-01 Here is an invaluable new book on quantitative gas chromatography which explains how the method can or should be used for accurate and precise analysis Gas chromatography is firmly established as one of the few major methods for the quantitative analysis of complex mixtures It is fast accurate and inexpensive with a broad range of applications It has however become very complex and involved over 200 stationary phases more than 10 detector principles and several very different column types are available from among the catalogs of over 100 manufacturers and major retailers The progressive changes in the nature of gas chromatography have created new needs for information which are not satisfied by the literature presently available This book provides a complete discussion of all the problems involved in the achievement of quantitative analysis by gas chromatography whether in the research laboratory in the routine analysis laboratory or in process control For this reason the presentation of theoretical concepts has been limited to the essential while extensive explanations have been devoted to the various steps involved in the derivation of precise and accurate data This starts with the selection of the instrumentation and column continues with the choice of optimum experimental conditions then calibration and ends with the use of correct procedures for data acquisition and calculations Finally there is almost always a

way to reduce errors and an entire chapter deals with this single issue Numerous relevant examples are presented The first part of the book presents the theoretical background simple enough to be understood by all analytical chemists but still complete and up to date It discusses the problems of flow dynamics retention and band broadening The changes in band profile associated with column overloading are explained without much recourse to mathematics The second part describes the gas chromatograph and discusses the properties of each of its parts gas flow and pressure controller sampling system oven column switching valves detectors The different implementations their advantages and drawbacks are discussed and compared In addition three chapters present packed column technology open tubular column technology and some sophisticated new phase systems respectively The new phase systems described use adsorbents modified by coating or grafting organic phase and carrier gases containing vapors which are sorbed by the stationary phase and modify it such as steam The third part discusses the applications in qualitative and quantitative analysis Calibration peak integration sources of errors arising from the various parts of the instrument as well as from the measurement process itself are carefully described in four detailed chapters Methods to carry out accurate and precise analysis are presented A last chapter is devoted to process control analysis and gives a number of detailed examples of applications A lexicon explaining the most important chromatographic terms and a detailed index complete the book This is a book which no chemical analyst should be without It should be on the library shelf of all universities instrument companies and any laboratory and plant where gas chromatography is used
