Rapid methods for food and feed quality determination A. van Amerongen,D. Barug,M. Lauwaars,2023-08-28 There is an ever increasing need for rapid methods and instrumentation in the field of food and feed quality Key issues dealt with in the food and feed industry include monitoring of processes at all stages showing due diligence in the control of food and nutritional quality achieving rapid results for detecting micro biological chemical and physical deterioration of food and feed and finally detecting rapidly and reliably food authenticity and or adulteration Developments in analytical techniques have led to the emergence of a wide range of rapid

methods to complement the traditional methods. Faster results, higher productivity, lower costs, and increased sensitivity are key concepts for all those involved in writing this book. Key topics include emerging rapid technologies, rapid monitoring of food and nutritional quality, rapid testing of quality deterioration and spoilage, rapid testing of authenticity and adulteration, quality tracking, tracing, and rapid testing. The methods and techniques presented here, in their varying degree of complexity, will be a valuable resource for researchers and professionals from the food and feed industry as well as from the scientific community. This book is an ideal supplement to *Rapid Methods for biological and chemical contaminants in food and feed* as published in 2005.

Flow Cytometry Ranbir Chander Sobti, Awtar Krishan, Devendra K. Agrawal, 2024-12-24. Flow cytometry is a state-of-the-art technology that is widely used in biological research and clinical diagnostics. It is a high-throughput platform that allows the quantification, differentiation, and functional study of cells or cell-like particles in suspension. Various cell components can be targeted with fluorescently labelled antibodies or fluorescent dyes to allow measurement and analysis of the physical, chemical, and biological properties of individual cells within homogeneous or heterogeneous populations. Since its commercialization more than five decades ago, flow cytometry has advanced and become a very important analytical tool in translational research. With the advancement of instrument technology, an increasing number of fluorescent dyes and an expanding range of monoclonal antibodies, the applications of flow cytometry in applied research continue to grow. The use of multiparametric flow cytometry in translational research provides the ability to rapidly identify different cell populations and to simultaneously measure multiple parameters of single cells for efficiently assessing immune status, decrease/increase of specific immune cell populations, cell activation status, etc. of different cells in preclinical and clinical studies. The primary goal of any research work is to take research results from the bench to bed and back. The use of flow cytometry in applied research advances the development of new diagnostic tests or drugs for cancer treatment, immune monitoring, etc. that help in patient care. Today every biological scientist needs to have basic knowledge of flow cytometry in order to utilise this technology properly in their own research and to understand other's research work. The present book has been designed to give the knowledge of flow cytometry and its applications to the researchers and teachers. It will allow the readers to utilize the technology in an appropriate way in their research work. This book describes various applications of flow cytometry like cell health monitoring, immunophenotyping, cell sorting, stem cell characterization, microvesicle analysis, etc.

Advances in Biomedical Sensing, Measurements, Instrumentation and Systems Aimé Lay-Ekuakille, 2009-12-24. Advances in technological devices unveil new architectures for instrumentation and improvements in measurement techniques. Sensing technology related to biomedical aspects plays a key role in nowadays applications; it promotes different advantages for healthcare, solving difficulties for elderly persons, clinical analysis, microbiological characterizations, etc. This book intends to illustrate and to collect recent advances in biomedical measurements and sensing instrumentation, not as an encyclopedia but as a support for scientists, students, and researchers in order to stimulate

Cell Cycle Checkpoint Control Protocols Howard B. Lieberman, 2008-02-02 The field of cell cycle regulation is based on the observation that the life cycle of a cell progresses through several distinct phases G1 M S and G2 occurring in a well defined temporal order Details of the mechanisms involved are rapidly emerging and appear extraordinarily complex Furthermore not only is the order of the phases important but in normal eukaryotic cells one phase will not begin unless the prior phase is completed successfully Checkpoint control mechanisms are essentially surveillance systems that monitor the events in each phase and assure that the cell does not progress prematurely to the next phase If conditions are such that the cell is not ready to progress for example because of incomplete DNA replication in S or DNA damage that may interfere with chromosome segregation in M a transient delay in cell cycle progression will occur Once the inducing event is properly handled for example DNA replication is no longer blocked or damaged DNA is repaired cell cycle progression continues Checkpoint controls have recently been the focus of intense study by investigators interested in mechanisms that regulate the cell cycle Furthermore the relationship between checkpoint control and carcinogenesis has additionally enhanced interest in these cell cycle regulatory pathways It is clear that cancer cells often lack these checkpoints and exhibit genomic instability as a result Moreover several tumor suppressor genes participate in checkpoint control and alterations in these genes are associated with genomic instability as well as the development of cancer
