## **Detecting And Classifying Low Probability Of Intercept Radar:**

**Detecting and Classifying Low Probability of Intercept Radar** Phillip E. Pace, 2004 Pace Naval Postgraduate School presents the principles of radar design that enable a low probability of intercept LPI by a noncooperative intercept receiver. The RF system uses complex pulse compression CW waveforms, low side lobe antennas and power management techniques to render itself virtually undetectable. The second part of the textbook investigates three algorithms for providing the intercept receiver with a processing gain that is close to the radar's matched filter processing gain and quantifies their performance with LPI waveforms. The CD ROM contains MATLAB code for evaluating the complex LPI radar receiver interactions.

**Detection and Classification of Low Probability of Intercept Radar Signals Using Parallel Filter Arrays and Higher Order Statistics** Fernando L. Taboada, 2002-09 Low probability of intercept LPI is that property of an emitter that because of its low power, wide bandwidth, frequency variability or other design attributes makes it difficult to be detected or identified by means of passive intercept devices such as radar, warning, electronic support and electronic intelligence receivers. In order to detect LPI radar waveforms, new signal processing techniques are required. This thesis first develops a MATLAB toolbox to generate important types of LPI waveforms based on frequency and phase modulation. The power spectral density and the periodic ambiguity function are examined for each waveform. These signals are then used to test a novel signal processing technique that detects the waveforms' parameters and classifies the intercepted signal in various degrees of noise. The technique is based on the use of parallel filter sub-band arrays and higher order statistics, third order cumulant estimator. Each sub-band signal is treated individually and is followed by the third order estimator in order to suppress any symmetrical noise that might be present. The significance of this technique is that it separates the LPI waveforms in small frequency bands, providing a detailed time frequency description of the unknown signal. Finally, the resulting output matrix is processed by a feature extraction routine to detect the waveforms' parameters. Identification of the signal is based on the modulation parameters detected.

Non-Line-of-Sight Radar Brian Watson, Joseph R. Guerri, 2019-02-28. Non-Line-of-Sight Radar is the first book on the new and exciting area of detecting and tracking targets via radar multipath without direct line of sight (DLOS). This revolutionary capability is finding new applications in the tracking of objects in non-line-of-sight (NLOS) urban environments, including detection and tracking of UAVs. This book brings together for the first time all the essential underpinnings and techniques required to develop and field a viable NLOS radar. It presents many examples, including electromagnetic radiation propagation in urban NLOS environments, extracting building location and morphology from readily available terrain databases, predictive ray tracing techniques, and multi-target NLOS tracking. Readers will learn how to apply radar to urban tracking that was previously deemed impossible. The book shows how real-time physics calculations can be incorporated into the radar processor and how existing radar hardware can be adopted for non-line-of-sight radar use without major upgrades. Including results from both high-fidelity physics-based simulations and actual flight test data, this book establishes the efficacy of NLOS radar in practical applications.
