Recent developments in electronically controlled systems for automobiles are focused on providing for soft magnetic materials that can provide a large electromagnetic flux with low eddy current losses, which will help the various systems better than developed in combination of high DC electromagnetic properties such as cold crystallization and permeability. This paper describes the recent development trends of soft magnetic steel and the achievement of steel developed steel (DCL-DCI system).

Introduction

Recently automobiles are being heavily equipped with various systems operated electrically, electronically and/or electrohydraulically to various sensors, control and fuel economy. Such systems include integrated controlled automatic transmission, electronic power steering (EPS) and anti-lock braking systems (ABS)¹⁻³.

In the early years (1970s, 1980s) when electric and electronic devices started to be used in automobiles, the main purpose was to improve and upgrade the performance of individual systems. Highly complicated vehicles started to mount power windows, air conditioning, high-speed lockage and numerous combination power, different systems. Hence electronically and/or electrohydraulically controlled management are becoming increasingly important.

Among these electronically and/or electrohydraulically controlled systems, components that utilize electromagnetic force (permeability loss) come to their minds to generate magnetic fields. Many conventional ones consist of low carbon steel, containing about 0.05% of carbon, to improve the response to control signals and increase energy efficiency.⁴⁻⁶ With the remarkable advancement of electromagnetic control in recent years, it has become essential to electronically components to have even higher performance and lower power consumption.

This paper describes the trend of soft magnetic materials, such as those for low losses used in electromagnetic components, and introduces the characteristics of the new, low-loss soft magnetic materials in the DCL-DCI (Steel Low Carbon Cold Heading Steel) series developed by New Steel.

by hydraulic control. This is a typical example of the electromagnetic components used in automobiles. Soft magnetic materials are usually used for these cases that have magnetic circuits and for the bearings, including sensors.

Early solenoid devices for automobiles were mainly used for controlling the oil flow by small sections. Thus, the stability and reliability of low cost materials were more important than their magnetic characteristics. As a result, low carbon steels such as SAE1010, SAE1015, SAE1018 and SAE1020 (JIS-C 1008) were used for the long years.

Recent solenoid devices, however, must be able to convert hydraulic energy well and stably. In contrast this, the small control is being replaced by larger control in many cases.⁷⁻⁹ On the other hand, the control current must be proportional to the galling force (electromagnetic force) of the low rates, which increases with magnetic materials having low coercivity (low hysteresis) at high flux density. The latest low loss steels maintain the same reliability, are required to have magnetic characteristics better than those of SAE1018 (JIS-C 1018), making it difficult to find carbon steel, formerly used for small control, to satisfy the required characteristics of magnetic materials and coercivity (Fig. 2).

In the mid-1990s, New Steel worked to totally change factors that can adversely affect the magnetic characteristics of soft magnetic materials and developed a soft magnetic material, DCL-DCI (Steel low loss steel), which can achieve the best characteristics among 98 grade (98-99%) steels.¹⁰ The company has studied parts having using a large power and parts having using a large current is being widely used as a soft magnetic material for coil binding.

In the late 1990s, there was an increasing need for
