members of the Android Security team this all star guide tackles the analysis and detection of malware that targets the Android operating system This groundbreaking guide to Android malware distills years of research by machine learning experts in academia and members of Meta and Google s Android Security teams into a comprehensive introduction to detecting common threats facing the Android eco system today Explore the history of Android malware in the wild since the operating system first launched and then practice static and dynamic approaches to analyzing real malware specimens Next examine machine learning techniques that can be used to detect malicious apps the types of classification models that defenders can implement to achieve these detections and the various malware features that can be used as input to these models Adapt these machine learning strategies to the identifica tion of malware categories like banking trojans ransomware and SMS fraud You ll Dive deep into the source code of real malware Explore the static dynamic and complex features you can extract from malware for analysis Master the machine learning algorithms useful for malware detection Survey the efficacy of machine learning techniques at detecting common Android malware categories The Android Malware Handbook s team of expert authors will guide you through the Android threat landscape and prepare you for the next wave of malware to come Android Malware and Analysis Ken Dunham,Shane Hartman,Manu Quintans,Jose Andre Morales,Tim Strazzere,2014-10-24 The rapid growth and development of Android based devices has resulted in a wealth of sensitive information on mobile devices that offer minimal malware protection This has created an immediate need for security professionals that understand how to best approach the subject of Android malware threats and analysis In Android Malware and Analysis Ken Dunham renowned global malware expert and author teams up with international experts to document the best tools and tactics available for analyzing Android malware The book covers both methods of malware analysis dynamic and static This tactical and practical book shows you how to use to use dynamic malware analysis to check the behavior of an application malware as it has been executed in the system It also describes how you can apply static analysis to break apart the application malware using reverse engineering tools and techniques to recreate the actual code and algorithms used The book presents the insights of experts in the field who have already sized up the best tools tactics and procedures for recognizing and analyzing Android malware threats quickly and effectively You also get access to an online library of tools that supplies what you will need to begin your own analysis of Android malware threats Tools available on the book s site include updated information tutorials code scripts and author assistance This is not a book on Android OS fuzz testing or social engineering Instead it is about the best ways to analyze and tear apart Android malware threats After reading the book you will be able to immediately implement the tools and tactics covered to identify and analyze the latest evolution of Android threats Updated information tutorials a private forum code scripts tools and author assistance are available at AndroidRisk com for first time owners of the book *Android Malware Detection using Machine Learning* ElMouatez Billah Karbab,Mourad Debbabi,Abdelouahid Derhab,Djedjiga Mouheb,2021-07-10 The authors develop a malware fingerprinting

framework to cover accurate android malware detection and family attribution in this book The authors emphasize the following 1 the scalability over a large malware corpus 2 the resiliency to common obfuscation techniques 3 the portability over different platforms and architectures First the authors propose an approximate fingerprinting technique for android packaging that captures the underlying static structure of the android applications in the context of bulk and offline detection at the app market level This book proposes a malware clustering framework to perform malware clustering by building and partitioning the similarity network of malicious applications on top of this fingerprinting technique Second the authors propose an approximate fingerprinting technique that leverages dynamic analysis and natural language processing techniques to generate Android malware behavior reports Based on this fingerprinting technique the authors propose a portable malware detection framework employing machine learning classification Third the authors design an automatic framework to produce intelligence about the underlying malicious cyber infrastructures of Android malware The authors then leverage graph analysis techniques to generate relevant intelligence to identify the threat effects of malicious Internet activity associated with android malware The authors elaborate on an effective android malware detection system in the online detection context at the mobile device level It is suitable for deployment on mobile devices using machine learning classification on method call sequences Also it is resilient to common code obfuscation techniques and adaptive to operating systems and malware change overtime using natural language processing and deep learning techniques Researchers working in mobile and network security machine learning and pattern recognition will find this book useful as a reference Advanced level students studying computer science within these topic areas will purchase this book as well **Static Analysis for Android Malware Detection Using Document Vectors** Utkarsh Raghav,2023 The prevalence of smart mobile devices has led to an upsurge in malware that targets mobile platforms The dominant market player in the sector Android OS has been a favourite target for malicious actors Various feature engineering techniques are used in the current machine learning and deep learning approaches for Android malware detection In order to correctly identify dependable features feature engineering for Android malware detection using multiple AI algorithms requires a particular level of expertise in Android malware and the platform itself The majority of these engineered features are initially extracted by applying different static and dynamic analysis approaches These allow researchers to obtain various types of information from Android application packages APKs such as required permissions opcode sequences and control flow graphs to name a few This information is used as is or in vectorised form for training supervised learning models Researchers have also applied Natural Language Processing techniques to the features extracted from APKs In order to automatically create feature vectors that can describe the data included in Android manifests and Dalvik executable files inside an APK this study focused on developing a novel method that uses static analysis and the NLP technique of document embeddings We designed a system that takes Android APK files as input documents and generates the feature embeddings This system removes the need for manual identification

extraction of features We use these embeddings to train various Android Malware detection models to experimentally evaluate the effectiveness of these automatically generated features The experiments were done by training and evaluating 5 different supervised learning models We did our experiments on APKs from two well known datasets DREBIN and AndroZoo We trained and validated our models with 4000 files training set We had kept separate 700 files test set which were not used during training and validation We used our trained models to predict the classes of the unseen file embeddings from the test set The automatically generated features allowed training of robust detection models The Android malware detection models performed best with Android manifest file embeddings concatenated with Dalvik executable file embeddings with some of the models achieving Precision Recall and Accuracy values above 99% consistently during development and over 97% against unseen file embeddings The prediction accuracy of the detection model trained on our automatically generated features was equivalent to the accuracy achieved by one of the most cited research works known as DREBIN which was 94% We also provided a simple method to directly utilise the file present in Android APK to create feature embeddings without scouring through Android application files to identify reliable features The resulting system can be further improved against new emerging threats and be better trained by just gathering more samples Deep Dynamic Analysis of Android Applications Eric David Gustafson,2014 The smartphone revolution has brought about many new computing paradigms which aim to improve upon the computing landscape as we knew it Chief among these is the app packetizing and trivializing the distribution and installation of software This has led to a boom in the mobile software industry but also an increased burden on security researchers to ensure the millions of apps available do not harm users This paper presents a partial solution to that problem Pyandrazzi a practical dynamic analysis system for Android applications Pyandrazzi aims to be more scalable more compatible and more thorough than any existing system and to provide more in formative data to analysts than was previously thought possible The system is a true black box solution and is able to perform this analysis without any source code or prior knowledge of the application whatsoever Unlike other similar systems which rely heavily on unrealistic modifications to Android our system employs the original Android virtual machine and libraries to provide a more natural environment for apps and to ease portability to new Android versions Novel contributions include an algorithm for more thoroughly exploring application modeled on common user interface design patterns a platform version independent means of obtaining method trace data and a method of using this data to calculate the method coverage of an application execution To evaluate the performance and coverage of the system we used 1750 of the top applications from the dominant Google Play app market and executed them under a variety of conditions We demonstrate that the algorithm we developed is more effective than random user interface interactions at achieving method coverage of an application We then discuss the performance of the system which can execute all 1750 apps for two minutes of run time each under heavy instrumentation in about 7 hours We then explore two practical applications of the system The first is a Host based Intrusion Detection System

HIDS concept implemented using application re writing techniques The system uses signatures based on high level API call activity as opposed vii to binary fingerprints or system call traces used in other systems In our tests we were able to reliably detect three families of malware for which we created signatures with zero false positives Secondly we explore Pyandrazzi s role in a recent study of advertising fraud on Android covering over 130 000 Android applications The system was used to analyze those apps that did not generate ad related traffic without user interaction Of the 7 500 apps without such traffic we found that 12 8% of applications would have generated ad traffic if they had been properly interacted with via their user interfaces We then explore augmenting Pyandrazzi to avoid interacting with advertising so that fraudulent behaviors can be better detected Using a set of rules based on advertising industry standards and common design patterns we were able to avoid ad related interactions in 97 6 percent of a test set of 1 000 apps
