Structural Dynamic Systems Computational Techniques and Optimization Cornelius T. Leondes,1999-03-22

Computational techniques for the analysis and design of structural dynamic systems using numerical methods have been the focus of an enormous amount of research for several decades In general the numerical methods utilized to solve these problems include two phases a spatial discretization by either the finite element method FEM or the finite difference method FDM and b solution of systems of time dependent second order ordinary differential equations In addition the significantly powerful advances in computer systems capabilities have put on the desks of structural systems designers enormous computing power either by means of increasingly effective computer workstations or else through PCs personal computers

whose increasing power has succeeded in marginalizing the computational power differences between PCs and workstations in many cases This volume is a comprehensive treatment of the issues involved in computational techniques in structural dynamic systems

Structural Analysis of Printed Circuit Board Systems Peter A. Engel, 2012-12-06 This book discusses the building blocks of electronic circuits the microchips transistors resistors condensers and so forth and the boards that support them from the point of view of mechanics What are the stresses that result from thermal expansion and contraction What are the elastic parameters that determine whether a component will survive a certain acceleration After an introduction to the elements of structural analysis and finite element analysis the author turns to components data and testing A discussion of leadless chip carriers leads to a detailed thermal analysis of pin grid arrays For compliant leaded systems both mechanical bending and twisting and thermal stresses are discussed in detail The book concludes with discussions of the dynamic response of circuit cards plated holes in cards and boards and the final assembly of cards and boards
