This paper investigates the macroeconomic factors influencing inflation dynamics in the short and long run, considering both domestic and external factors. Utilizing quarterly data and employing Autoregressive Distributed Lag (ARDL) and Error Correction Model (ECM) methodologies, the paper finds that the exchange rate is the primary long-term price driver due to Afghanistan's reliance on imports and foreign aid, followed by money supply and international commodity prices. In the short run, inflation is persistent, and broad money has a significant impact on inflation compared to external factors.

**Applied Economic Forecasting using Time Series Methods** Eric Ghysels, Massimiliano Marcellino, 2018-03-23. Economic forecasting is a key ingredient of decision making both in the public and in the private sector. Because economic outcomes are the result of a vast complex dynamic and stochastic system, forecasting is very difficult and forecast errors are unavoidable. Because forecast precision and reliability can be enhanced by the use of proper econometric models and methods, this innovative book provides an overview of both theory and applications. Undergraduate and graduate students learning basic and advanced forecasting techniques will be able to build from strong foundations, and researchers in public and private institutions will have access to the most recent tools and insights. Readers will gain from the frequent examples that enhance understanding of how to apply techniques first by using stylized settings and then by real data applications focusing on macroeconomic and financial topics. This is first and foremost a book aimed at applying time series methods to solve real world forecasting problems. **Applied Economic Forecasting using Time Series Methods** starts with a brief review of basic regression analysis with a focus on specific regression topics relevant for forecasting such as model specification errors, dynamic models, and their predictive properties as well as forecast evaluation and combination. Several chapters cover univariate time series models, vector autoregressive models, cointegration and error correction models, and Bayesian methods for estimating vector autoregressive models. A collection of special topics chapters study Threshold and Smooth Transition Autoregressive, TAR and STAR models, Markov switching regime models, state space models, and the Kalman filter, mixed frequency data models, nowcasting, forecasting using large datasets, and finally volatility models. There are plenty of practical applications in the book, and both EViews and R code are available online at authors' website.
