*A World on the Wing: The Global Odyssey of Migratory Birds* Scott Weidensaul, 2021-03-30 New York Times Bestseller  
Finalist for the Los Angeles Times Book Prize A Library Journal Best Science and Technology Book of the Year An exhilarating exploration of the science and wonder of global bird migration In the past two decades our understanding of the navigational and physiological feats that enable birds to cross immense oceans fly above the highest mountains or remain in unbroken flight for months at a stretch has exploded What we've learned of these key migrations how billions of birds circumnavigate the globe flying tens of thousands of miles between hemispheres on an annual basis is nothing short of extraordinary Bird migration entails almost unfathomable endurance like a sparrow sized sandpiper that will fly nonstop from Canada to Venezuela the equivalent of running 126 consecutive marathons without food water or rest avoiding dehydration by drinking moisture from its own muscles and organs while orienting itself using the earth's magnetic field through a form of quantum entanglement that made Einstein queasy Crossing the Pacific Ocean in nine days of nonstop flight as some birds do leaves little time for sleep but migrants can put half their brains to sleep for a few seconds at a time alternating sides and their reaction time actually improves These and other revelations convey both the wonder of bird migration and its global sweep from the mudflats of the Yellow Sea in China to the remote mountains of northeastern India to the dusty hills of southern Cyprus This breathtaking work of nature writing from Pulitzer Prize finalist Scott Weidensaul also introduces readers to those scientists researchers and bird lovers trying to preserve global migratory patterns in the face of climate change and other environmental challenges Drawing on his own extensive fieldwork in *A World on the Wing* Weidensaul unveils with dazzling prose the miracle of nature taking place over our heads

**Environmental Hazards Methodologies for Risk Assessment and Management** Nicolas R. Dalezios, 2017-02-15

From the beginning of 21st century there has been an awareness of risk in the environment along with a growing concern for the continuing potential damage caused by hazards. In order to ensure environmental sustainability a better understanding of natural disasters and their impacts is essential. It has been recognized that a holistic and integrated approach to environmental hazards needs to be attempted using common methodologies such as risk analysis which involves risk management and risk assessment. Indeed risk management means reducing the threats posed by known hazards whereas at the same time accepting unmanageable risks and maximizing any related benefits. The risk management framework involves evaluating the importance of a risk either quantitatively or qualitatively. Risk assessment comprises three steps namely risk identification, data base, event monitoring, statistical inference, risk estimation, magnitude, frequency, economic costs and risk evaluation, cost benefit analysis. Nevertheless the risk management framework also includes a fourth step risk governance i.e. the need for a feedback of all the risk assessment undertakings. There is currently a lack of such feedback which constitutes a serious deficiency in the reduction of environmental hazards. This book emphasises methodological approaches and procedures of the three main components in the study of environmental hazards namely forecasting, nowcasting, before monitoring, during and assessment after based on geoinformatic technologies and data and simulation through examples and case studies. These are considered within the risk management framework and in particular within the three components of risk assessment namely risk identification, risk estimation and risk evaluation. This approach is a contemporary and innovative procedure and constitutes current research in the field of environmental hazards. Environmental Hazards: Methodologies for Risk Assessment and Management covers hydrological hazards (floods, droughts, storms, hail, desertification), biophysical hazards (frost, heat waves, epidemics, forest fires), geological hazards (landslides, snow, avalanches), tectonic hazards (earthquakes, volcanoes) and technological hazards. This book provides a text and a resource on environmental hazards for senior undergraduate students, graduate students on all courses related to environmental hazards and risk assessment and management. It is a valuable handbook for researchers and professionals of environmental science, environmental economics and management and engineering. Editor: Nicolas R. Dalezios, University of Thessaly, Greece. **Meteorologische Zeitschrift**, 2006. **Polarimetric Doppler Weather Radar** V. N. Bringi, V. Chandrasekar, 2001-08-30. This 2001 book provides a detailed introduction to the principles of Doppler and polarimetric radar focusing in particular on their use in the analysis of weather systems. The design features and operation of practical radar systems are highlighted throughout the book in order to illustrate important theoretical foundations. The authors begin by discussing background topics such as electromagnetic scattering, polarization and wave propagation. They then deal in detail with the engineering aspects of pulsed Doppler polarimetric radar including the relevant signal theory, spectral estimation techniques and noise considerations. They close by examining a range of key applications in meteorology and remote sensing. The book will be of great use to graduate students of electrical engineering and atmospheric science as well as to practitioners involved in the applications of polarimetric radar.
