Advanced Silicon MMICs for mm-Wave Automotive Radar Front-Ends Alexander Kravets, 2015-06-12 This work presents a high linearity automotive radar front end at 77 GHz in 0.25 μ m SiGe technology. The passive elements were realized using thin film microstrip lines. A detailed transformer balun synthesis procedure was developed. The realized passive baluns rat race and transformer show excellent commonmode rejection ratios exceeding 30 dB and low losses of 2.5 dB. On the active side a low gain high linearity single stage common emitter LNA was realized. The selected topology allowed finer trade off between linearity and sensitivity of the front end compared to multi stage LNA solutions. For the mixer a low voltage supply high linearity low noise double balanced concept was employed. It uses AC coupling between the two stages which allowed an independent optimization of transconductance core sizing and bias. The transconductance was designed for best noise performance while the core was chosen for maximum linearity. A high fidelity two channel receiver was realized using these circuit components which achieved a performance comparable to the published state of the art results in SiGe. Single sideband noise figure better than 16.5 dB, 1 dB compression point exceeding 12 dBm while consuming moderate 82 mA DC current from a 1.6 V supply for both channels. *Quantum Computing Architecture and Hardware for Engineers* Hiu Yung Wong, 2025-03-27 The purpose of this book is to teach quantum computing hardware from an engineer's perspective.
