

Q1- Plot how the frequency changes in a 2500 kg car as the possible stiffness values range from 120,000 N/m to 170,000 N/m. Express your answer in Hz.

Q2- The acceleration of a machine part modeled as a spring-mass system is measured and recorded in Figure P 1.31. Compute the amplitude of the displacement of the mass.

Q3- Plot the solution of a linear, spring and mass system with frequency $\omega_n = 1 \text{ rad/s}$, $x_0 = 2 \text{ mm}$ and $v_0 = -2 \text{ mm/s}$, for at least two periods.

Q4- An automobile is modeled as a 1000 kg mass supported by a spring of stiffness $k = 400,000 \text{ N/m}$. When it oscillates it does so with a maximum deflection of 10 cm. When loaded with passengers, the mass increases to as much as 1300 kg. Calculate the change in frequency, velocity amplitude, and acceleration amplitude if the maximum deflection remains 10 cm.

Q5- Consider a spring-mass-damper system, like the one in Figure 1.10, with the following values: $m = 10 \text{ kg}$, $c = 3 \text{ N/s}$ and $k = 1000 \text{ N/m}$. a) Is the system overdamped, underdamped or critically damped? b) Compute the solution if the system is given initial conditions $x_0 = 0.01 \text{ m}$ and $v_0 = 0$.

Q6- Plot $x(t)$ for a damped system of natural frequency $\omega_n = 2 \text{ rad/s}$ and initial conditions $x_0 = 1 \text{ mm}$, $v_0 = 1 \text{ mm/s}$, for the following values of the damping ratio: $\zeta = 0.05$, $\zeta = 0.2$, $\zeta = 0.5$, $\zeta = 0.4$, and $\zeta = 0.8$.

Mechanics of Sandwich Structures A. Vautrin, 2013-06-29 The main advantages of sandwiches as structural components are now well known and well established Due to the progress in polymer science and engineering and advances in manufacturing processes sandwich structures can blend various functional and structural properties and therefore lead to highly innovating systems The current difficulty to overcome is to provide designers with proper methodologies and tools that could enable them to design improved sandwich structures Such dedicated design tools should be efficient reliable flexible and user friendly They should be based on advanced knowledge of sandwich behaviour at global and local scales Such approach relies on our capability to test identify control and model structure performances The impressive variety of core and face materials and the rapid developments in forming processes give new opportunities to design components which have more complex shapes and higher integrated functional and structural properties Interest in sandwiches is permanently growing in industry and refined testing and modelling approaches should be encouraged to set up relevant guidelines to design reliable advanced structures The European Society for Mechanics sponsored the EUROMECH 360 Colloquium on the Mechanics of Sandwich Structures in Saint Etienne France on 13 15 May 1997 The main purpose of EUROMECH 360 was to go into the most recent progresses in sandwich analysis and design including mechanical modelling and testing It was expected that the Colloquium should contribute to define new research directions to support development of advanced applications in strategic industrial sectors such as ground transportations or building and civil engineering

Convexity and connectivity of the solution space in machine learning problems Maxime Hardy,2019-01-24 ScientiaRerum Thesis 2018 This thesis investigates properties of the solution space of the machine learning problem of random pattern classification Such properties as convexity of the space of solutions its connectivity and clusterization are studied Evidence has been provided recently that there exists a universality class for random pattern classification models making it possible to study the properties of the whole set of constraint satisfaction problems using the most simple model the perceptron with spherical constraint it is exactly solvable and exhibits the full stack of characteristic properties of that class In order to obtain statistically representative treatment of the model as opposed to the best worst case scenarios we used the well established methods of theoretical physics of disordered systems a k a spin glasses In terms of that science this model can be interpreted as a random packing problem and demonstrates the phenomenology of slow glassy relaxation and a jamming transition The specific property of that model is that the corresponding constraint satisfaction problems ceases to be convex The non convex domain is explored in detail in this thesis and its structure is presented on a phase diagram Publisher Scientia Rerum academic publishers Paris **Professional Engineer** ,1985
