 microbiology Microbial whole genome sequencing WGS can provide identification characterization and subtyping of
 pathogens for epidemiological investigations at a level of precision previously not possible This allows for connections and
 source attribution to be inferred between related isolates that may be overlooked by traditional techniques The archiving and
 global sharing of genome sequences allow for retrospective analysis of virulence genes antimicrobial resistance markers
 mobile genetic elements and other novel genes The advent of high throughput 16S rRNA amplicon sequencing in
 combination with the advantages offered by massively parallel second generation sequencing for metagenomics enable
 intensive studies on the microbiomes of food products and the impact of foods on the human microbiome These studies may
 one day lead to the development of reliable culture independent methods for food monitoring and surveillance Similarly RNA
 seq has provided insights into the transcriptomes and hence the behaviour of bacterial pathogens in food food processing
 environments and in interaction with the host at a resolution previously not achieved through the use of microarrays and or
 RT PCR The vast untapped potential applications of NGS along with its rapidly declining costs give this technology the
 ability to contribute significantly to consumer protection global trade facilitation and increased food safety and security
 Despite the rapid advances challenges remain How will NGS data be incorporated into our existing global food safety
 infrastructure How will massive NGS data be stored and shared globally What bioinformatics solutions will be used to
 analyse and optimise these large data sets This Research Topic discusses recent advances in the field of food microbiology
