Abstract— This paper labels the study of hybrid fiber reinforced concrete specimen's structural behavior elements. Fibers influenced on the hybrid reinforced specimens structural characteristics are analyzed. Samples having various fiber-volume fractions will be explored. Structural characteristics investigates test like compressive strength, flexural strength and tensile strength. The incorporation of Steel and Polyester (Recron 35) fiber varies from range 0.1 to 1% volume fraction. From the results obtained the concrete specimens made with 0.5 % possess high structural behavior compared to other specimens made. The results attained is also equated with the predictable specimens of beam and beam-column joint.

1 INTRODUCTION

Concrete is generally delivered and widely used than all other as a construction material,. Concrete strength varies with the preparations and the incorporations of the material involved in the manufacturing, like Plain concrete possesses a very less tensile strength and little resistance to cracking [1,2]. In addition with these the microstructural study like internal micro cracks are characteristically present in the concrete if the concrete possess low strength and improper arrangements. Such micro cracks lead to the propagation of poor tensile strength which, in the long run leading to fragile fracture of the concrete. The mandatory reason for incorporating the fibers include it reduces the air voids reasonably, in addition with the reduction of water voids. Creep resistance can be attained with the incorporation of graphite and glass fibers. [3,4,5].

Modulus of elasticity of fiber plays a major role in fiber reinforced concrete for efficient stress transfer. Fibers like steel, carbon and glass gives high modulus and stiffness. This the major reason for selecting the Steel fiber in this project. The sequential factor also plays vital role in incorporating the fiber is volume of fibers. The higher addition more than the optimum would result in segregation and harshness in the concrete specimens. [6, 7]. Aspect ratio of fibers remains the constant reason for the selection of quantity of fibers, where it differs based on the properties and nature of concrete. The optimum aspect ratio is 75 where it exceeds the concrete attains certain less toughness and strength.

Orientation of fibers plays some roles in the toughness and strength attained in FRC. From the study the fibers arranged parallel to the applied load attains quite high results when compared to orientations done random and perpendicular to the load. The orientation continued with the size and shape of the fiber imply in the applications like steel fibers round in shape available as reinforcement.

Thus from the above conditions the steel fiber proposed to use is crimped round steel fiber and is purchased from Bakul castings. The Recron 35 fibers are purchased from Reliance Regional Office in Bangalore.

Besides, steel reinforcement is espoused to overcome high theoretically tensile stresses and shear stresses at critical location in concrete member. When the root analysis of this most cases induce that micro cracks development should be suppressed with the method of additional of additives or filler materials which significantly increase the strength of concrete, which in turn produce concrete with homogenous tensile properties [9]. The expansion of strands was gotten as an answer for create concrete in perspective on expanding its elastic and flexural quality, custom of fastener that could join Portland concrete in the holding with concrete frameworks. [13, 14, 15]. Fiber strengthened cement (FRC) is made up with concrete, different sizes of aggregate, which coordinate with discrete, irregular filaments. Filaments are most regularly spasmodic, arbitrarily dispersed all through the concretes frameworks. [16,17]
