MACHINE LEARNING IT'S ALGORITHMS, MODELS AND APPLICATIONS IN FINANCE AND BIOMEDICAL FIELDS AND CHALLENGES Mr. Pavan Patel,Mrs. Jinal Bhatt,Miss. Dhruvi Suthar,Dr. Mohit Pravinchandra Bhadla,2023-02-22 A classic example of a complicated system and one of the most fiercely argued and discussed topics is the monetary and economic system It is made up of a very diverse group of participants such as banks mutual funds hedge funds insurance firms pension funds and shadow banks Every one of them not only communicates directly with one another but also with the actual economy which is in and of itself

an extremely complicated system The worldwide financial crisis that started in 2008 is the perfect illustration of a developing phenomena which is one of the defining characteristics of a complex system A confluence of events served as the catalyst for the catastrophe Although there is no complete consensus on the causes of the crisis there is a widespread belief that the crisis can be summarized as follows Mortgage backed securities were a financial market innovation that brought greater convenience to lenders This led to an increase in the number of loans extended to households and the purchase of large amounts of overdraft securities Mortgage backed securities were one of the factors that contributed to the 2008 financial crisis Credit liberalization helped develop a housing bubble and when it burst multiple global large corporations held substantial mortgage backed securities in the portfolios of most financial institutions caused great losses The loosening of lending standards was another factor that led to the expansion of the housing market As a result credit was suspended which prevented the core activities of the real economy from obtaining funding As a result there was a global recession that caused an estimated fifty trillion dollars in losses in the global economy This is equivalent to half of one year s world GDP

MACHINE LEARNING APPLICATIONS IN FINANCE Dr. Hemant N. Patel, Dr. Mitesh J. Patel, Mr. Sunil P. Patel, Shakti Bharatbhai Dodiya, 2023-07-17 In order to tackle the computer challenge we will need an algorithm A collection of instructions that must be carried out in order to transform

an input into an outcome is referred to as an algorithm One illustration of this would be the development of an algorithm to produce a classification Your ordered list is the result and the input is a series of numerical values to be arranged You might be interested in discovering the most effective algorithm which either needs fewer instructions or less memory or both and you might discover that there are numerous algorithms for the same work On the other hand we do not have an algorithm for certain tasks such as determining what constitutes spam and what constitutes legitimate e mail We are aware of the nature of the entry which is a simple typeface file contained within an email document We are aware of the expected outcome which is a yes no answer signifying whether or not the communication should be considered spam We are not familiar with the process of converting information to output The definition of what constitutes spam shifts over time and differs from one individual to the next Using statistics we are able to compensate for our dearth of understanding We are able to quickly collect thousands of example messages some of which we are aware are spam and would like to learn more about how they are constructed Therefore we would like the computer machine to automatically determine the procedure that should be used for this work There is no need for you to learn how to arrange numbers because we already have algorithms for that however there are many applications with example data that do not require an algorithm Because of developments in computer technology we are now able to store and analyze large quantities of data as well as retrieve this data from geographically dispersed locations through the use of a computer network Most data acquisition instruments today are computerized and capture accurate data

Kanungo, 2023-08-14 Whether based on academic theories or discovered empirically by humans and machines all financial models are at the mercy of modeling errors that can be mitigated but not eliminated Probabilistic ML technologies are based on a simple and intuitive definition of probability and the rigorous calculus of probability theory Unlike conventional AI systems probabilistic machine learning ML systems treat errors and uncertainties as features not bugs They quantify uncertainty generated from inexact model inputs and outputs as probability distributions not point estimates Most importantly these systems are capable of forewarning us when their inferences and predictions are no longer useful in the current market environment These ML systems provide realistic support for financial decision making and risk management in the face of uncertainty and incomplete information Probabilistic ML is the next generation ML framework and technology for AI powered financial and investing systems for many reasons They are generative ensembles that learn continually from small and noisy financial datasets while seamlessly enabling probabilistic inference prediction and counterfactual reasoning By moving away from flawed statistical methodologies and a restrictive conventional view of probability as a limiting frequency you can embrace an intuitive view of probability as logic within an axiomatic statistical framework that comprehensively and successfully quantifies uncertainty This book shows you why and how to make that transition *Journal of Financial Education* ,2008
