**fast-dissolving oral films for pediatric use** Verena Ingeborg Garsuch,2009-06-24 Oral films also called oral wafers are intended for the application in the oral cavity and they are an innovative and promising dosage form especially for use in pediatrics and geriatrics On the one hand the studies focused on the development of such a dosage form for pediatric use with an appropriate active substance On the other hand it was planned to develop adequate analytical methods for their characterization as well as improving already existing approaches Drug free films were prepared according to the patent literature starting with a pre evaluation of different film formers such as cellulose ethers polyethylene glycol polyvinyl alcohol copolymer Kollicoat IR pullulan and sodium alginate Gelatin hypromellose polyvinyl alcohol and pullulan were evaluated for further use in drug loaded oral films in which caffeine was chosen as the API The best compromise between fast dissolution and pleasant taste was shown for oral films made of gelatin and pullulan Improving their palatability by using different sweeteners flavors and dyes led to two formulations with pleasant taste without any bitterness The oral films based on different formulations were evaluated with regard to their morphology mechanical and thermal properties

Recrystallization of caffeine occurred within the drug loaded oral wafers which led to non uniform distribution of API and caused limited content uniformity for oral wafers made of gelatin and one hypromellose type HM50PA2910 Furthermore residual solvent was determined by different methods In the formulations that contained ethanol as solvent this alcohol could not be quantified in the finished products making the oral wafers safe for pediatric use The results from the investigations of osmolalities of dissolved films in appropriate medium showed values far below the critical threshold for cell necrosis which

additionally approves the applicability of oral wafers to pediatrics An attempt to simulate the disintegration and dissolution behavior in the human oral cavity was made by developing methods using a fiber optic sensor contact angle meter or determination of swelling Since only a small amount of saliva is present in the oral cavity the development of an adequate method proved to be difficult It was revealed that oral wafers showed fast dissolving behavior both in vitro and in vivo although they had a drug load of 10 mg caffeine However the present study revealed that recrystallization of API may be problematic Further studies should be aimed at preventing the recrystallization which occurred in the case of caffeine The developed approaches especially for dissolution testing should be improved to better mimic the natural conditions Adequate methods to determine mucoadhesion are another possibility for prediction of the suitability of film formers for use in the oral cavity Ultimately the packaging of those oral wafers will play a considerable role in ascertaining and increasing their stability In conclusion in the present work the development of oral drug loaded wafers was successful Although the wafers contain 10 mg caffeine which is a bitter tasting substance the taste was assessed as comfortable and pleasant The manufactured oral wafers were characterized by several methods and found out to be stable even without primary packaging An evaluation of appropriate film formers for oral use could be undertaken

**Orodispersible Minitabletten** Ines Stoltenberg, 2012-04-27 Seit dem Inkrafttreten der EU Verordnung über Kinderarzneimittel besteht ein erhöhter Bedarf an kindgerechten Arzneiformen. Der in den letzten Jahren angestoßene Paradigmenwechsel weg von flüssigen hin zu festen oralen Darreichungsformen erfordert die Entwicklung fester Darreichungsformen, die schon bei Säuglingen und Kleinkindern angewendet werden können. Daher wird in der vorliegenden Arbeit als neuer Ansatz die Orodispersible Minitablette (ODMT) vorgestellt, die Orodispersible Tabletten mit Minitabletten kombiniert. Es konnten erstmals arzneistofffreie ODMTs mit dem gebrauchsfertigen Hilfsstoff Ludiflash R mit einer ausreichenden Bruchkraft von 8 N und gleichzeitig kurzer Benetzungszeit (3 s) entwickelt werden. Darüber hinaus konnten ODMTs mit Ludiflash R und Hydrochlorothiazid in kindgerechten Dosierungen hergestellt werden. Diese Zubereitungen zeigten eine zerfallsabhängige Wirkstofffreisetzung, die mit Hilfe einer selbstständig entwickelten Freisetzungsschaltung demonstriert werden konnte. Der erstmals durchgeführte Vergleich von fünf kommerziellen gebrauchsfertigen Hilfsstoffen Ludiflash R, Pearlitol R, Flash, Parteck R ODT, Prosolv R ODT und Pharmaburst R 500 zeigte vielfältige Unterschiede der ODMTs hinsichtlich der Zerfallszeiten und der mechanischen Eigenschaften. Die anschließend hergestellten ODMTs mit Hydrochlorothiazid entsprachen den Vorgaben des Europäischen Arzneibuchs hinsichtlich der Gleichförmigkeit des Gehalts einzeldosierter Arzneiformen. Der Arzneistoffgehalt blieb über einen Lagerungszeitraum von sechs Monaten unter Stressbedingungen konstant. Mit vier von fünf Hilfsstoffen konnten außerdem ODMTs mit einer vollständigen Arzneistofffreisetzung (15 Minuten) entwickelt werden. Die verwendeten Hilfsstoffprodukte wurden mit physikalischen Mischungen von Einzelkomponenten und Trockengranulaten der gleichen Zusammensetzung verglichen. Es wurden insgesamt vergleichbare Ergebnisse erzielt, so dass kein Vorteil der gebrauchsfertigen Hilfsstoffe gegenüber den physikalischen Mischungen im Rahmen der durchgeführten Untersuchungen ermittelt werden konnte. Darüber hinaus wurden erstmals ODMTs mit Zinksulfat als Arzneistoff entwickelt und charakterisiert. Der Einfluss der Kombination aus Zinksulfat und Hilfsstoff auf das Zerfallsverhalten von Tabletten wurde näher untersucht. Zudem konnte ein erfolgreiches Konzept zur Geschmacksmaskierung von Zinksulfat in ODMTs entwickelt werden. Im Rahmen einer Geschmackscharakterisierung durch erwachsene Probanden konnten Schlüsse hinsichtlich der Geschmacksmaskierung getroffen werden. Die Ergebnisse der Messungen mit einer elektronischen Zunge korrelierten gut mit den Ergebnissen des Probandenkollektivs. Außerdem wurde der Vergleich verschiedener In vitro Methoden zur Untersuchung des Zerfalls von ODMTs durchgeführt. Die Ergebnisse wurden mit Ergebnissen eines In vivo Tests verglichen. Die wichtigsten Charakteristika einer geeigneten Methode zur Untersuchung des Zerfalls konnten definiert werden. Der Simulated Wetting Test sowie die Zerfallstests mit dem Electro

ForceR Instrument und mit dem rotierenden Stempel stellten sich als die am besten geeigneten Methoden heraus Zusammenfassend lässt sich sagen dass die Entwicklung orodispersibler Minitabletten mit Hydrochlorothiazid und mit geschmacksmaskiertem Zinksulfat gelungen ist Somit steht eine neue technologische Plattform zur Verfügung die die Herstellung flexibel dosierbarer fester oraler Darreichungsformen mit konventionellen Tablettenpressen ermöglicht Besonders Kinder können von dieser Neuentwicklung profitieren Eine Applikation der ODMTs bei Kindern Formulation, Evaluation and Optimization of Mouth Dissolving Tablets Amita Yadav,Kamal Singh Rathore,Geeta M.
