Recommendations for Stay Cable Design, Testing and Installation Post-Tensioning Institute. Committee on Cable-Stayed Bridges, 2001 Published in SI units and re organized into a Load and Resistance Factor Design LRFD format designed to be used with the AASHTO LRFD Bridge Design Code Recommendations for Stay Cable Design, Testing, and Installation, 1990 The recommendations are intended to provide guidance for development of project specifications for stay cables

Acceptance of Stay Cable Systems Using Prestressing Steels fib Fédération internationale du béton, 2005-01-01 This fib Recommendation gives technical guidelines regarding design testing acceptance installation qualification inspection and maintenance of stay cable systems using prestressing steels strands wires or bars as tensile elements which can be applied internationally This Recommendation is applicable for cable stayed bridges and other suspended structures such as roofs It may also be used for hangers in arch structures and as suspension cables as appropriate This Recommendation has been formulated by an international working group comprising more than 20 experts from administrative authorities universities laboratories owners structural designers suppliers of prestressing steels and stay cable suppliers The text has been written to cover best construction practices around the world and to provide material specifications that are considered to be the most advanced available at the time of preparing this text For ease of use for client designer and cable supplier the complex content has been arranged thematically according to the system components into chapters focusing on performance characteristics requirements and acceptance criteria Requirements and comments have been specified for all parties involved in design and construction in order to aim for a uniform and high quality and durability The interfaces to the structural designer are highlighted The essential subjects are Design and detailing of stay cables including saddles and damping devices Durability requirements and corrosion protection systems Requirements for the materials Testing requirements for the stay cables Installation tolerances qualification of companies and personnel Inspection maintenance and

repair This Recommendation does not cover the technology of stay cables whose tensile elements are ropes locked coil cables etc or which consist of composite materials Nevertheless in many cases the specified performance criteria may also be applicable to these systems although numerical values given for the acceptance criteria may need to be adjusted For these systems it has been difficult to provide multiple protective layers similar to those specified for stay cables made from prestressing steel and therefore the quality of corrosion protection may not be equivalent While extradosed cables have similarities with stay cables generally agreed design and system acceptance criteria are not yet available and therefore this type of cable is not covered *Recommendations for Stay Cable Design and Testing*, 1986 The recommendations are intended to provide guidance for development of project specifications for stay cables and to provide a basis for the development of future specifications when more experience and more test data are available

Acceptance of stay cable systems using prestressing steels FIB - International Federation for Structural Concrete, 2019-03-01 Cable stayed structures have become increasingly popular over the last 30 years and have been used in all parts of the world Modern cable stayed bridges have a history of over 50 years and have been constructed with span lengths ranging from 15 m to over 1000 m Many long span cable stayed bridges have been built for railway and highway traffic applications Stay cables have also been used on pedestrian structures many of which are architecturally striking and have become landmark structures There is growing use in building structures particularly for cable supported roofs Most of the cable supported structures have been in the form of cable stayed bridges but in recent years extradosed bridges have seen increased popularity among the designers Led by the experience in Japan more than 200 extradosed bridges have been constructed worldwide in the past 15 years The first edition of these fib recommendations was published as fib Bulletin 30 in 2005 and was the first specification published by fib for stay cable systems This new bulletin has been updated based on Bulletin 30 with the aim to reflect the current state of the art and encompass the latest knowledge in cable systems In addition it has been the aspiration of Commission 5 and Task Group 5.5 to harmonize the guidance in this updated bulletin with other stay cable recommendations from around the world including those from Europe Japan and the USA This new bulletin is intended to supersede and replace fib Bulletin 30 It is recommended that it be used in lieu of fib Bulletin 30 for all future cable supported applications The updated bulletin introduces several significant enhancements to the specifications These recommendations are applicable to both stay cable and extradosed cable applications In the past there has been some debate over the boundary between cable stayed and extradosed bridges This bulletin presents a new continuous approach valid for both A completely new testing requirement to assess the performance of cable systems under bending fatigue including both anchorages and saddles if applicable has been added Testing requirements for saddle systems have been reformulated In addition to the bending fatigue test noted above new testing procedures for stay cable saddles with isolated tensile elements are introduced This includes tests for saddle axial fatigue friction and tensile testing and determination of the effective

saddle friction coefficient Expanded system qualification including requirements for both stay cable and extradosed applications Includes new provisions for MTE qualification and additional load transferring connection devices Minimum number of tests is specified for each A new in situ damping measurement test has been added to verify the actual damping ratio of the damping devices installed By testing on site selected cables may be excited to vibrate without and with the damping devices so that the observed vibration behaviour can be compared to the specified value Other revisions have been made to reflect the current state of practice Expanded quality control testing requirements Inclusion of epoxy coated prestressing steel as a protection layer Previous recommendations only considered zinc coatings Specifications for epoxy coating material are given Requirements for stainless steel components such as pipes caps and plates Updated guidance for designing lightning protection systems Detailed recommendations for different levels of inspection of cable systems including initial routine detailed and exceptional inspections An updated list of references relevant standards and extended literature
