Communication Systems for Electrical Engineers Mohammad A. Matin, 2017-12-28 This book is written as a very concise introduction for students taking a first course in communication systems. It provides the reader with fundamentals of digital communication systems and disseminates the essentials needed for the understanding of wire and wireless communication systems for Electrical Engineers. It covers important topics right from the beginning of the subject which communication engineers must understand. Example problems in each chapter will help them in understanding the materials well. The study of data networking will include multiple access, reliable packet transmission, routing and protocols of the internet. The concepts taught in class will be discussed in the context of aerospace communication systems, aircraft communications, satellite communications. The book includes example problems in each chapter to help the reader in understanding the materials well.

Digital and Analog Communication Systems Leon W. Couch, 2007 For second and third year introductory communication systems courses for undergraduates or an introductory graduate course. This revision of Couch's authoritative text provides the latest treatment of digital communication systems. The author balances coverage of both digital and analog communication systems with an emphasis on design. Students will gain a working knowledge of both classical mathematical and personal computer methods to analyze design and simulate modern communication systems. MATLAB is integrated throughout.

Interference Potential of Ultrawideband Signals Michael Cotton, 2007 The purpose of this book is to provide data needed to predict the interference potential of various UWB signals. The results will be useful for regulatory agencies that are currently charged with defining UWB emission limits and corresponding compliance measurement procedures. They will also be useful to the ultrawideband communications industry which will only thrive if compliance measurement procedures fairly evaluate interference potential of all UWB signals. The approach is to inject carefully characterised interference into an operating narrow band receiver and measure susceptibility of the receiver with precisely defined signal quality metrics. Data is then analysed to determine if there are common signal characteristics that predict interference potential. The victim receiver chosen for this interference susceptibility test is C band satellite digital television DTV. This receiver demodulates signals transmitted in the 3.7 to 4.2 GHz frequency range which lies within the band allocated for UWB devices. The authors chose to generate the satellite signal in the laboratory rather than use an unpredictable live signal to generate interference signals with a vector signal generator rather than rely solely on prototype devices and to perform signal and system characterisation measurements primarily with the vector signal analyser to provide comprehensive data capable of being post processed in many ways.
