

Control of Blood Sugar Levels

What hormones are involved in the homeostasis of blood sugar?

Why?

All living things use glucose as a source of energy. In vertebrates it is critical that the levels of glucose in the blood are consistent. Small fluctuations are fine, but if the glucose concentration in the blood gets too high, a coma could result. If the glucose concentration in the blood gets too low, the person could experience seizures, go into a coma or die. In humans, hormone levels help regulate the glucose concentration in the blood and keep us in homeostasis.

What is Blood Sugar? The blood sugar (glucose) level is the amount of sugar (glucose) present in the blood of human or animals. When blood sugar (glucose) level rises too high, it's called hyperglycemia. When blood sugar (glucose) level drops too low, it's called hypoglycemia.

Basic Facts about Blood Sugar, Glucose, and Insulin

Glucose: a simple sugar is the primary source of energy for the cells of the body. Glucose comes from the foods (carbohydrates) we eat. The body converts the carbohydrates into sugar. It is also formed and stored inside the body. After meals, an adequate quantity of insulin hormone is automatically released by the pancreas. Blood carries the glucose from the intestines or liver to body cells. Insulin makes it possible for cells to take in the glucose from blood. In other words, insulin helps absorption of glucose by cells.

Level of blood sugar starts dropping soon after it starts entering the cell. Blood sugar levels fluctuate throughout the day.

MEASUREMENT OF BLOOD SUGAR

- 1 milligram deciliter (mg/dL): Blood sugar is measured in milligram deciliter.
- 2 millimoles per litre (mmol/L): Blood sugar is also measured in millimoles per litre.
- mmol/L is also called millimolars (mM). Note: 1 mmol/L is equivalent to 18 mg/dL.
- 3 DCCT HbA1c %: Blood sugar levels over the last 3 months are measured through an A1C test. Finding is represented as a percentage. The range may fall in between 4-15%.

Red blood cells in our body may last up to 3 months or 12 weeks before getting regenerated. Therefore, average of glycated hemoglobin in blood over 3 months is taken for discerning the average blood glucose level. DCCT stands for Diabetes Control and Complications Trial.

- 4 IFCC HbA1c mmol/mol: Findings of A1C Test may also be represented in millimoles per mole.
- mmol/mol: IFCC stands for International Federation of Clinical Chemistry.

NOTE: IFCC HbA1c mmol/mol = DCCT HbA1c % - 2.15

10-929: WHAT IS HbA1C? HbA1c refers to Glycated hemoglobin. Glycated hemoglobin is measured to identify the average plasma glucose concentration over prolonged periods of time. Glucose molecules are inclined to attach to the hemoglobin in red blood cells and form the glycated hemoglobin. Lower levels of glucose produce a lower amount of glycated hemoglobin. Normal levels of glucose

produce a normal amount of glycated hemoglobin Higher levels of glucose produce a higher amount of glycated hemoglobin
02 Different Stages of Blood Sugar Level of blood sugar glucose in your body changes throughout the day and night Blood sugar depends on quantity and timing of food you have eaten More importantly it depends on what you have eaten
