Bayesian Analysis in Natural Language Processing Shay Cohen, 2022-11-10 Natural language processing NLP went through a profound transformation in the mid 1980s when it shifted to make heavy use of corpora and data driven techniques to analyze language Since then the use of statistical techniques in NLP has evolved in several ways One such example of evolution took place in the late 1990s or early 2000s when full fledged Bayesian machinery was introduced to NLP This Bayesian approach to NLP has come to accommodate for various shortcomings in the frequentist approach and to enrich it especially in the unsupervised setting where statistical learning is done without target prediction examples We cover the methods and algorithms that are needed to fluently read Bayesian learning papers in NLP and to do research in the area These methods and algorithms are partially borrowed from both machine learning and statistics and are partially developed in house in NLP We cover inference techniques such as Markov chain Monte Carlo sampling and variational inference Bayesian estimation and nonparametric modeling We also cover fundamental concepts in Bayesian statistics such as prior distributions conjugacy and generative modeling Finally we cover some of the fundamental modeling techniques in NLP such as grammar modeling and their use with Bayesian analysis

Phonology in Multilingual Grammars John Archibald, 2024 This book explores questions about the nature of an interlanguage grammar i e the grammar of a bilingual John Archibald approaches these questions within a cognitive science perspective that draws upon abstract representational structures in demonstrating that phonological knowledge underlies the surface phonetic properties of L2 speech Specifically he proposes that interlanguage grammars are not impaired fundamentally different or shallow as some have argued the phonological grammars are complex hierarchically structured mental representations that are governed by the principles of linguistic theory including those of Universal Grammar The book outlines a model that addresses Plato's problem learning in the absence of evidence and Orwell's problem resistance to learning in the face of abundant evidence Furthermore the study of grammatical interfaces phonetics phonology morphology phonology syntax reveals the necessary design conditions for an internally consistent

architecture for a comprehensive model of second language speech The resulting empirically motivated model is parsimonious in accounting for all aspects of L2 speech from phonological feature to segment to word to sentence The book concludes by discussing why phonology has been underrepresented in generative approaches to second language acquisition and examining some of the implications of second language phonology for applied linguistics and language pedagogy

DFT-Domain Based Single-Microphone Noise Reduction for Speech Enhancement Richard C. Hendriks, Timo Gerkmann, Jesper Jensen, 2022-05-31 As speech processing devices like

mobile phones voice controlled devices and hearing aids have increased in popularity people expect them to work anywhere and at any time without user intervention However the presence of acoustical disturbances limits the use of these applications degrades their performance or causes the user difficulties in understanding the conversation or appreciating the device A common way to reduce the effects of such disturbances is through the use of single microphone noise reduction algorithms for speech enhancement The field of single microphone noise reduction for speech enhancement comprises a history of more than 30 years of research In this survey we wish to demonstrate the significant advances that have been made during the last decade in the field of discrete Fourier transform domain based single channel noise reduction for speech enhancement Furthermore our goal is to provide a concise description of a state of the art speech enhancement system and demonstrate the relative importance of the various building blocks of such a system This allows the non expert DSP practitioner to judge the relevance of each building block and to implement a close to optimal enhancement system for the particular application at hand
