Exergy Analysis and Thermoconomics of Buildings Jose M Sala-Lizarraga, Ana Picallo-Perez, 2019-10-01. Quantifying exergy losses in the energy supply system of buildings reveals the potential for energy improvement which cannot be discovered using conventional energy analysis. Thermoconomics combines economic and thermodynamic analysis by applying the concept of cost, an economic concept, to exergy as exergy is a thermodynamic property fit for this purpose in that it combines the quantity of energy with its quality factor. *Exergy Analysis and Thermoconomics of Buildings* applies exergy analysis methods and thermoconomics to the built environment. The mechanisms of heat transfer throughout the envelope of buildings are analyzed from an exergy perspective and then to the building thermal installations, analyzing the different components such as condensing boilers, absorption refrigerators, microgeneration plants, etc., including solar installations and finally the thermal facilities as a whole. A detailed analysis of the cost formation process is presented, which has its physical roots firmly planted in the second law of thermodynamics. The basic principles and the rules of cost allocation in energy units, exergy cost in monetary units, exergoeconomic cost, and in CO<sub>2</sub> emissions, exergoenvironmental cost based on the so-called Exergy Cost Theory are presented and applied to thermal installations of buildings. Clear and rigorous in its exposition, *Exergy Analysis and Thermoconomics of Buildings* discusses exergy analysis and thermoconomics and the role they could play in the analysis and design of building components, either the envelope or the thermal facilities, as well as the diagnosis of thermal installations. This book moves progressively from introducing the basic concepts to applying them. *Exergy Analysis and Thermoconomics of Buildings* provides examples of specific cases throughout this book. These cases include real data so that the results obtained are useful to interpret the inefficiencies and losses that truly occur in actual installations; hence, the assessment of their effects encourages the manner to improve efficiency. Applies exergy analysis methods for the installation of building thermal facilities equipment, components including pipes, valves, heat exchangers, boilers, and heat pumps. Helps readers determine the operational costs of heating and cooling building systems. Includes exergy analysis methods that are devoted to absorption refrigerators.

**Convexification and Global Optimization in Continuous and Mixed-Integer Nonlinear Programming** Mohit Tawarmalani, Nikolaos V. Sahinidis, 2013-04-17 Interest in constrained optimization originated with the simple linear programming model since it was practical and perhaps the only computationally tractable model at the time. Constrained linear optimization models were soon adopted in numerous application areas and are perhaps the most widely used mathematical models in operations research and management science at the time of this writing. Modelers have however found the assumption of linearity to be overly restrictive in expressing the real world phenomena and problems in economics, finance, business, communication, engineering, design, computational biology, and other areas that frequently demand the use of nonlinear expressions and discrete variables in optimization models. Both of these extensions of the linear programming model are NP hard, thus representing very challenging problems. On the brighter side, recent advances in algorithmic and computing technology make it possible to revisit these problems with the hope of solving practically relevant problems in reasonable amounts of computational time. Initial attempts at solving nonlinear programs concentrated on the development of local optimization methods guaranteeing globality under the assumption of convexity. On the other hand, the integer programming literature has concentrated on the development of methods that ensure global optima. The aim of this book is to marry the advancements in solving nonlinear and integer programming models and to develop new results in the more general framework of mixed integer nonlinear programs (MINLPs) with the goal of devising practically efficient global optimization algorithms for MINLPs.
