Overview

The implementation of the Wireless Power Consortium's (WPC's) Qi standard¹ brings wireless power to many different end applications. The receiver (Rx) coil for each application may have different geometries and/or power requirements. Since the Rx coil is a key component in a successful and efficient design of a Qi-compliant Rx and there are many design options and trade-offs to consider, the designer must take a careful and methodical approach when realizing a solution. This article provides the technical insight needed to realize a successful Rx-coil design. It covers the Qi-compliant system model as a basic transformer; Rx-coil measurements and system-level influences; and methods of qualifying a design for successful operation. It is assumed that the reader has a general understanding of the Qi-compliant inductive power system. Background information can be found in Reference 2.

Qi-compliant system as a transformer

For many near-field wireless power systems such as the one specified by the WPC, the behavior of the magnetic power transfer can be modeled by a simple transformer. A traditional transformer usually has a single physical structure with two windings around a core material that is highly permeable compared to air (Figure 1). Since the traditional transformer uses a highly permeable material to carry the magnetic flux, most (not all) of the flux produced by one coil couples to the second coil. This coupling, which can be measured through a parameter known as the coupling coefficient, is denoted as k (a measure that can have a value between 0 and 1).

Three parameters define a two-coil transformer:

L_{11} is the self-inductance of coil 1.

L_{22} is the self-inductance of coil 2.

L_{12} is the mutual inductance of coils 1 and 2.

The coefficient for coupling between the two coils can be formulated as

$$k = \frac{L_{12}}{\sqrt{L_{11}L_{22}}} \quad (1)$$

The ideal transformer then can be modeled by using a coupled inductor as shown in Figure 2.

Using the voltage and current relationship of an inductor can provide the nodal equations of this two-coil transformer:

$$V_1 = L_{11} \frac{di_1}{dt} + L_{12} \frac{di_2}{dt} \quad (2a)$$

Figure 1. Traditional transformer with one physical structure

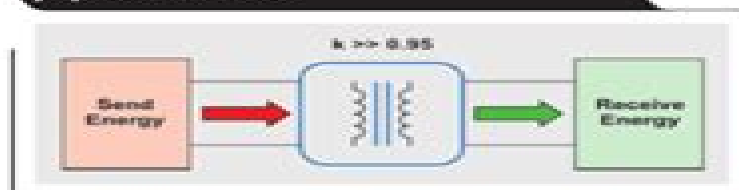

Figure 2. Ideal model of a traditional transformer

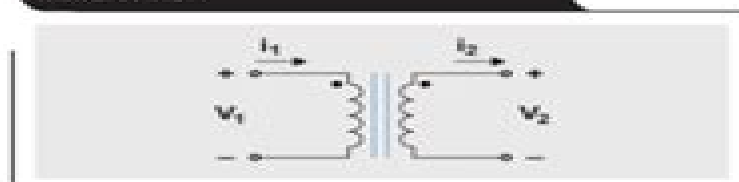

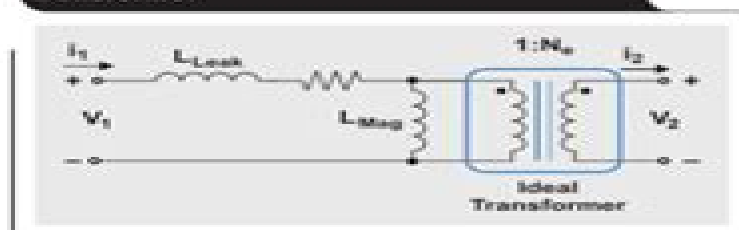

Figure 3. Cantilever model of a traditional transformer

$$V_2 = L_{22} \frac{di_2}{dt} + L_{12} \frac{di_1}{dt} \quad (2b)$$

For circuit analysis, the model in Figure 2 can be represented by what traditionally is referred to as a cantilever model, shown in Figure 3. Here the magnetic coupling and mutual inductance are simplified to leakage and magnetizing inductances. This allows the physical nature of the

Effect of Receiver Coil Diameter on the Power Transfer Capability for 5 KHz Wireless Power Transfer System Muhammad Najmul Fadli,2022 This study was conducted to design and construct a WPT system The WPT system uses a 5 kHz of frequency The circuit converts a DC source to an AC voltage by a single phase half wave bridge inverter consisting of 12 transistors TIP35C 6 transistors each polarity Furthermore this study only uses the PIC16F628A microcontroller in the pulse driver to generate a frequency of 5 kHz not NE555 IC The technique used is an electromagnetic field inductive resonance technique by making a solenoid shaped copper coil used to produce a mutual inductance Mutual Inductance M that showed on the picture is the interaction of one coil s

magnetic field on another coil as it induces a voltage in the adjacent coil Nataraj et al 2017 The 5 kHz WPT system in this study uses a receiving coil varied in 3 different diameters some of them are a receiver coil with 50 cm of diameter coil 50 receiver coil with 16 cm of diameter coil 16 and 9 cm of diameter coil 9 Although the diameter is different the inductance value for each receiver coil is the same While the transmitter coil only uses a coil with a diameter of 50 cm Furthermore The study was conducted by comparing the simulation results and the results of direct data measurements of the WPT system by multimeters WPT system simulation was carried out using PSIM and then the resulting data were processed using MATLAB and Microsoft Excel This study does not use LTSpice as an application to perform simulations When the simulation can be run hardware is built for the WPT system with a system frequency of 5 kHz Moreover in this study multi receiver settings are also used to compare the effect of adding a receiver coil to the WPT system output The receiver coil is arranged in alignment with the transmitter coil which means the distance between the transmitter coil and the receiver coil or multi receiver coil are the same

Efficient Wireless Power Transfer with Capacitively Segmented RF Coils Sebastian Stöcklin, Adnan Yousaf, Gunnar Gidion, Leonhard M. Reindl, 2020

Abstract Wireless power transfer systems have been widely applied in the field of portable and implantable devices featuring contact free and reliable energy supply Novel implant systems such as brain computer interfaces impose the challenges of strong miniaturization and operation under loosely coupled conditions Therefore maximizing power transfer efficiency while decreasing the size of transmitter and receiver structures becomes a central research question This paper presents a unified design strategy of modeling analyzing and optimizing planar spiral coils with integrated capacitive elements so called capacitively segmented coils for operation in wireless power transfer interfaces It mathematically analyzes and experimentally verifies that the combination of capacitive coil segmentation increased operational frequencies and geometrical coil optimization can be used to establish wireless power transfer links with comparatively high efficiency small size and limited detuning effects in lossy dielectric environments The paper embraces the formulation and verification of a broadband analytical link model based on partial element equivalent circuits which is subsequently used to determine dominant coupling and loss mechanisms and to optimize the coils geometries for high efficiency Moreover an extended analysis shows how the capacitive coil segmentation can effectively suppress dielectric losses and non uniform current distributions by canceling the inductive contribution of every coil segment at the frequency of operation Utilizing these methods an exemplary 40 68MHz wireless power link with a 30mm primary and a 10mm secondary coil is designed and evaluated With a maximum efficiency of up to 31% in biological tissue at 20mm separation distance it features efficiency levels which are up to ten times higher and a specific absorption rate which is up to five times lower compared to non segmented systems When operated at 150MHz in air efficiency levels are up to 1.5 times higher than in state of the art systems of the same size

Time-domain Modeling of Wireless Power Transfer in Motion Using Inductively Coupled Flat Spiral Coils Joshua Nathan Turnbull, 2020

In current commercial technologies wireless power transfer WPT occurs when the item charging and the charger are not in motion Products such as wireless chargers for cell phones cars and some internet of things IoT devices have stationary wireless chargers A limiting factor of these chargers is in a single transfer coil system the coils need to be aligned perfectly and the device must be physically touching the charger If it is not minimal or no power is transferred and the device is not charged

This set up allows manufacturers to simplify design and modeling as a steady state system In this thesis the receiving coil is in motion over the embedded transfer coil The industrial standard to discern how the system would react uses finite element analysis FEM which is very resource intensive and time consuming The point of this thesis is to model and approximate the potential of a WPT system to help discern the viability of designs therein reducing the number of resources and time necessary to find an optimum solution A Series Series Compensated Wireless Power Transfer circuit was solved using Thevenin Equivalent Circuits and converted into a state space equation Using MATLAB and Simulink the circuit was modeled and compared to another study to validate the results Variables such as frequency load resistance vertical and horizontal offset were then changed to see how the output voltage waveform and power transfer changed Due to the receiving coil s motion a steady state is not reached and the system has transient states The effects on the waveforms thoughts about optimization and possible future studies are discussed

Large Area Wireless Power Transfer with Coupled Relay Resonators Xingyi Shi, 2019 Emerging wireless charging technologies will become essential for medical implants which currently require cables passing through patients skin in order to provide power or force the patient to undergo costly surgery operations to replace dead batteries Likewise makers of sensors and devices used on the factory floor are increasingly looking towards wireless power to eliminate the need for battery changes and eliminate downtime Even the ever increasing number and diversity of consumer electronics such as smartphones laptops wearables and VR headsets will benefit from wireless power solutions that make battery charging more convenient Commercially available wireless chargers such as those implementing the Qi standard partially address the problem Qi chargers can typically charge only one device at a time and require precise alignment of transmitter and receiver and so are not effective as the number of electronics that need to be charged increases Magnetic resonance wireless power transfer systems which use resonant coils as transmitters have greater range and tolerance to misalignment However the size of the transmitter cannot be arbitrarily increased to fit any large area because large transmitter to receiver size ratios result in extreme inefficiency As an enhancement on magnetic resonance phased array transmitters explored in academic research can extend transmission range However they have the tradeoff of increased cost and complexity because each array element requires an independent RF source Non magnetic methods of wireless power transfer such as radiative ultra high frequency beaming and tracking laser systems have more extended power transfer range but much less efficiency and they both have lower output power limits due to safety regulations So whereas these methods may be useful for devices that only need small amount of energy and require long separation distances they cannot be used for systems that require high power output while still being safe for use near humans and animals This dissertation focuses on the design of a wireless power transfer solution that can provide efficient wireless charging over a large area can tolerate some amount of separation and misalignment can charge multiple devices at the same time at a reasonable complexity and cost and can do all of this while staying well within safety regulations To

achieve this we introduce an adaptive passive wireless relay system to extend power transfer range A prototype of a centrally controlled array of reconfigurable relays CARR is implemented that can deliver power to multiple moving receivers We show that the relay system is much more efficient at delivering power to small receivers over a large area than a single transmitter system and has better uniformity of coverage The CARR prototype can identify and adaptively route power to a new or moving receiver in as little as 120 microseconds Additionally a method for enabling large area power transfer without a large transmitter is introduced which proposes to use receivers themselves as relays when many receivers are in close proximity We demonstrate a key step towards realizing this receivers as relay system by showing that a suitable routing configuration for delivering power to receivers can be identified using a load modulation technique Finally in evaluating the safety of magnetic resonance systems we conclude an interesting feature of coupled resonator systems which reduces safety concerns by reducing the SAR a measure of the energy absorbed by biological tissue
