Aspects of Signal Processing With Emphasis on Underwater Acoustics, Part 2 G. Tacconi, 2012-12-06 This paper describes the results of current research at DREA in which techniques of optimum array processing are being applied to active sonar We are presenting these results at the Advanced Study Institute in order to illustrate some actual applications for such processing and to point out some of the practical considerations which arise in real systems In particular the paper concerns the problems which arise when the individual sensor elements have a complicated directivity pattern themselves This is a common phenomenon in active systems where the receiving sensors are complex resonant structures and are housed in a dome or towed body presenting various baffling and diffraction effects Most treatments of array processing consider ideal elements which have well behaved directivity properties and are transparent to the field The results of this paper show that where these properties are not met careful in situ array measurements are required and even with such measurements practical array gains may not be as good as predictions based on ideal sensors

Aspects of Signal Processing G. Tacconi, 1977-04-30 The summer school held in Portovenere followed a tutorial format with the purpose of familiarizing postdoctoral or postgraduate students in the basic theories and up to date applications of present knowledge Although from a teaching point of view a certain amount of overlapping is always useful in order to avoid excessive duplication direct contact between lecturers expert in the same subject was encouraged during the preparation phase In recent years computer facilities and theoretical implementation have considerably increased the possibility of solving problems relating to signal detection in noise Any type of communication may take advantage of signal processing principles including any type of physical measurement that can be considered as a non semantic and or quasi semantic communication Since signal processing techniques are common to many branches of science telecommunications radar sonar seismology geophysics nuclear research space research and others the advanced and sophisticated levels reached singularly in any one of them could be used to the advantage of the others In particular underwater acoustics is a discipline which to

some extent represents a practical general model that has permitted the development of signal processing techniques suitable to meet data reduction and interpretation needs of other branches of science This ASI consequently underlined the inter disciplinaryity of signal processing in order that the principles of outstanding methods developed in one field may be adapted to others

Fundamentals of Shallow Water Acoustics Boris Katsnelson, Valery Petnikov, James Lynch, 2012-02-22 Shallow water acoustics SWA the study of how low and medium frequency sound propagates and scatters on the continental shelves of the world's oceans has both technical interest and a large number of practical applications Technically shallow water poses an interesting medium for the study of acoustic scattering inverse theory and propagation physics in a complicated oceanic waveguide Practically shallow water acoustics has interest for geophysical exploration marine mammal studies and naval applications Additionally one notes the very interdisciplinary nature of shallow water acoustics including acoustical physics physical oceanography marine geology and marine biology In this specialized volume the authors all of whom have extensive at sea experience in US and Russian research efforts have tried to summarize the main experimental theoretical and computational results in shallow water acoustics with an emphasis on providing physical insight into the topics presented

Topics in Non-Gaussian Signal Processing Edward J. Wegman, Stuart C. Schwartz, John B. Thomas, 2012-12-06 Non Gaussian Signal Processing is a child of a technological push It is evident that we are moving from an era of simple signal processing with relatively primitive electronic circuits to one in which digital processing systems in a combined hardware software configuration are quite capable of implementing advanced mathematical and statistical procedures Moreover as these processing techniques become more sophisticated and powerful the sharper resolution of the resulting system brings into question the classic distributional assumptions of Gaussianity for both noise and signal processes This in turn opens the door to a fundamental reexamination of structure and inference methods for non Gaussian stochastic processes together with the application of such processes as models in the context of filtering estimation detection and signal extraction Based on the premise that such a fundamental reexamination was timely in 1981 the Office of Naval Research initiated a research effort in Non Gaussian Signal Processing under the Selected Research Opportunities Program
