A book is like a window that allows you to look into the world. The window is shaped by the author and that makes that every window presents a unique view of the world. This is certainly true for this book. It is shaped by the topics and the projects throughout my career. Even more so, this book reflects my own style of working and thinking. That starts already in Chap 2. When I joined Philips Research in 1979, many of my colleagues used little paper notebooks to keep track of the most used equations and other practical things. This notebook was the beginning for Chap 2, a collection of topics that form the basis for much of the other chapters. Chapter 2 is not intended to explain these topics but to refresh your knowledge and help you when you need some basics to solve more complex issues. In the chapters discussing the fundamental processes of conversion, you will recognize my preoccupation with mathematics. I really enjoy finding an equation that properly describes the underlying mechanism. Nevertheless, mathematics is not a goal in itself; the equations help to understand the way the variables are connected to the result. Real insight comes from understanding the physics and electronics. In the chapters on circuit design, I have tried to reduce the circuit diagrams to the simplest form but not simpler. I do have private opinions on what works and what should not be applied.

Studies on Selected Topics in Radio Frequency Digital-to-Analog Converters Mohammad Reza Sadeghi, 2019-10-14

The network latency in fifth generation mobile technology 5G will be around one millisecond, which is much lower than in 4G technology. This significantly faster response time, together with higher information capacity and ultra-reliable communication in 5G technology, will pave the way for future innovations in a smart and connected society. This new 5G network should be built on a reasonable wireless infrastructure and 5G radio base stations that can be vastly deployed. That is, while the electrical specification of a radio base station in 5G should be met in order to have the network functioning, the size, weight, and power consumption of the radio system should be optimized to be able to commercially deploy these radios in a huge network. As the number of antenna elements increases in massive multiple input multiple output based radios, such as in 5G, designing true multi-band base station radios with efficient physical size, power consumption, and cost in emerging cellular bands, especially in mid-band frequencies up to 10 GHz, is becoming a challenge. This demands a hard integration of radio components, particularly the radio's digital application specific integrated circuits (ASIC) with high performance, energy efficient multi-band data converters. In this dissertation, radio frequency digital-to-analog converter (RF DAC) and semi-digital finite impulse response (FIR) filter digital-to-analog converter have been studied. Different techniques are used in these structures to improve the transmitter's overall performance. In the RF DAC part, a radio frequency digital-to-analog converter solution is presented which is capable of monolithic integration into today's digital ASIC due to its digital in nature architecture while fulfills the stringent requirements of cellular network radio base station linearity and bandwidth. A voltage mode conversion method is used as output stage and configurable mixing logic is employed in the data path to create

a higher frequency lobe and utilize the output signal in the first or the second Nyquist zone and hence achieving output frequencies up to the sample rate In the semi digital FIR part optimization problem formulation for semi digital FIR digital to analog converter is investigated Magnitude and energy metrics with variable coefficient precision are defined for cascaded digital Sigma Delta modulators semi digital FIR filter and Sinc roll off frequency response of the DAC A set of analog metrics as hardware cost is also defined to be included in semi digital FIR DAC optimization problem formulation It is shown that hardware cost of the semi digital FIR DAC can be reduced by introducing flexible coefficient precision in filter optimization while the semi digital FIR DAC is not over designed either Different use cases are selected to demonstrate the optimization problem formulations A combination of magnitude metric energy metric coefficient precision and analog metric are used in different use cases of the optimization problem formulation and solved to find out the optimum set of analog FIR taps Moreover a direct digital to RF converter DRFC is presented in this thesis where a semi digital FIR topology utilizes voltage mode RF DAC cells to synthesize spectrally clean signals at RF frequencies Due to its digital in nature design the DRFC benefits from technology scaling and can be monolithically integrated into advance digital VLSI systems A fourth order single bit quantizer bandpass digital Sigma Delta modulator is used preceding the DRFC resulting in a high in band signal to noise ratio SNR The out of band spectrally shaped quantization noise is attenuated by an embedded semi digital FIR filter The RF output frequencies are synthesized by a configurable voltage mode RF DAC solution with a high linearity performance A compensation technique to cancel the code dependent supply current variation in voltage mode RF DAC for radio frequency direct digital frequency synthesizer is also presented in this dissertation and is studied analytically The voltage mode RF DAC and the compensation technique are mathematically modeled and system level simulation is performed to support the analytical discussion

Digital-to-analog Converter Interface for Computer Assisted Biologically

Inspired Systems Nicholas Conley Poore, 2014 In today's integrated circuit technology system interfaces play an important role of enabling fast reliable data communications. A key feature of this work is the exploration and development of ultra low power data converters. Data converters are present in some form in almost all mixed signal systems; in particular digital to analog converters present the opportunity for digitally controlled analog signal sources. Such signal sources are used in a variety of applications such as neuromorphic systems and analog signal processing. Multi dimensional systems such as biologically inspired neuromorphic systems require vectors of analog signals. To use a microprocessor to control these analog systems we must ultimately convert the digital control signal to an analog control signal and deliver it to the system. Integrating such capabilities of a converter on chip can yield significant power and chip area constraints. Special attention is paid to the power efficiency of the data converter. The data converter design discussed in this thesis yields the lowest power consumption to date. The need for a converter with these properties leads us to the concept of a scalable array of power efficient digital to analog converters, the channels of which are time domain multiplexed so that chip area is minimized while preserving performance. To take further advantage of microprocessor capabilities an analog to digital design is proposed to return the analog system's outputs to the microprocessor in a digital form. A current steering digital to analog converter was chosen as a candidate for the conversion process because of its natural speed and voltage to current translation properties. This choice is nevertheless unusual because current steering digital to analog converters have a reputation for high performance with high power consumption. A time domain multiplexing scheme is presented such that a digital data set of any size is synchronously multiplexed through a finite array of converters, minimizing the total area and power consumption. I demonstrate the suitability of current steering digital to analog converters for ultra low power operation with a proof of concept design in a widely available 130 nm CMOS technology. In statistical simulation the proposed digital to analog converter was capable of 8 bit 100 kSps operation while consuming 231 nW of power from a 1 V supply.

Smart and Flexible Digital-to-Analog Converters Georgi Radulov, Patrick Quinn, Hans Hegt, Arthur H.M. van Roermund, 2011-01-07 Smart and Flexible Digital to Analog Converters proposes new concepts and implementations for flexibility and self correction of current steering digital to analog converters (DACs) which allow the attainment of a wide range of functional and performance specifications with a much reduced dependence on the fabrication process. DAC linearity is analysed with respect to the accuracy of the DAC unit elements. A classification is proposed of the many different current steering DAC correction methods. The classification reveals methods that do not yet exist in the open literature. Further, this book systematically analyses self calibration correction methods for the various DAC mismatch errors. For instance, efficient calibration of DAC binary currents is identified as an important missing method. This book goes on to propose a new methodology for correcting mismatch errors of both nominally identical unary as well as scaled binary DAC currents. A new

concept for DAC flexibility is presented The associated architecture is based on a modular design approach that uses parallel sub DAC units to realize flexible design functionality and performance Two main concepts self calibration and flexibility are demonstrated in practice using three DAC testchips in 250nm 180nm and 40nm standard CMOS Smart and Flexible Digital to Analog Converters will be useful to both advanced professionals and newcomers in the field Advanced professionals will find new methods that are fully elaborated from analysis at conceptual level to measurement results at test chip level New comers in the field will find structured knowledge of fully referenced state of the art methods with many fully explained novelties p DAC linearity is analysed with respect to the accuracy of the DAC unit elements A classification is proposed of the many different current steering DAC correction methods The classification reveals methods that do not yet exist in the open literature Further this book systematically analyses self calibration correction methods for the various DAC mismatch errors For instance efficient calibration of DAC binary currents is identified as an important missing method This book goes on to propose a new methodology for correcting mismatch errors of both nominally identical unary as well as scaled binary DAC currents A new concept for DAC flexibility is presented The associated architecture is based on a modular design approach that uses parallel sub DAC units to realize flexible design functionality and performance Two main concepts self calibration and flexibility are demonstrated in practice using three DAC testchips in 250nm 180nm and 40nm standard CMOS Smart and Flexible Digital to Analog Converters will be useful to both advanced professionals and newcomers in the field Advanced professionals will find new methods that are fully elaborated from analysis at conceptual level to measurement results at test chip level New comers in the field will find structured knowledge of fully referenced state of the art methods with many fully explained novelties This book goes on to propose a new methodology for correcting mismatch errors of both nominally identical unary as well as scaled binary DAC currents A new concept for DAC flexibility is presented The associated architecture is based on a modular design approach that uses parallel sub DAC units to realize flexible design functionality and performance Two main concepts self calibration and flexibility are demonstrated in practice using three DAC testchips in 250nm 180nm and 40nm standard CMOS Smart and Flexible Digital to Analog Converters will be useful to both advanced professionals and newcomers in the field Advanced professionals will find new methods that are fully elaborated from analysis at conceptual level to measurement results at test chip level New comers in the field will find structured knowledge of fully referenced state of the art methods with many fully explained novelties Two main concepts self calibration and flexibility are demonstrated in practice using three DAC testchips in 250nm 180nm and 40nm standard CMOS Smart and Flexible Digital to Analog Converters will be useful to both advanced professionals and newcomers in the field Advanced professionals will find new methods that are fully elaborated from analysis at conceptual level to measurement results at test chip level New comers in the field will find structured knowledge of fully referenced state of the art methods with many fully explained novelties
