and Dynamic Analysis of Structures J.F. Doyle, 2012-12-06 This book is concerned with the static and dynamic analysis of structures Specifically it uses the stiffness formulated matrix methods for use on computers to tackle some of the fundamental problems facing engineers in structural mechanics This is done by covering the Mechanics of Structures its rephrasing in terms of the Matrix Methods and then their Computational implementation all within a cohesive setting Although this book is designed primarily as a text for use at the upper undergraduate and beginning graduate level many practicing structural engineers will find it useful as a reference and self study guide Several dozen books on structural mechanics and as many on matrix methods are currently available A natural question to ask is why another text An odd development has occurred in engineering in recent years that can serve as a backdrop to why this book was written With the widespread availability and use of computers today's engineers have on their desktops an analysis capability undreamt of by previous generations However the ever increasing quality and range of capabilities of commercially available software packages has divided the engineering profession into two groups a small group of specialist program writers that know the ins and outs of the coding algorithms and solution strategies and a much larger group of practicing engineers who use the programs It is possible for this latter group to use this enormous power without really knowing anything of its source

The condition assessment of aged structures is becoming a more and more important issue for civil infrastructure management systems. The continued use of existing systems is due to environmental, economical and socio-political aspects of great significance and is growing larger every year. Thus the extent of necessary repair of damaged reinforced concrete structures is of major concern in most countries today. Monitoring techniques may have a decisive input to limit expenditures for maintenance and repair of existing structures. Modern test and measurement methods as well as computational mechanics open the door for a wide variety of monitoring applications. The need for quantitative and qualitative knowledge has led to the development and improvement of surveillance techniques which have already found successful application in other disciplines such as medicine, physics and chemistry. The design of experimental test and measurement systems is inherently an interdisciplinary activity. The specification of the instrumentation to measure the structural response will involve the skills of civil, electrical and computer engineers. The main aim of fib Commission 5 Structural Service Life Aspects is to provide a rational procedure to obtain an optimal technical-economic performance of concrete structures in service and to ensure a feedback of experience gained to design, execution, maintenance and rehabilitation. Against this background, fib Task Group 5.1 Monitoring and Safety Evaluation of Existing Concrete Structures had been established to evaluate the existing practice worldwide. The objective of this state-of-the-art report is to summarize the most important inspection and measuring methods to describe the working process and to evaluate the applicability to structural monitoring. Particular emphasis is placed upon non-destructive systems, lifetime monitoring, data evaluation and safety aspects.
