Veterinary PCR Diagnostics

Links Between Recombination and Replication Proceedings of the National Academy of Sciences, 2002-09-18 There has been a sea change in how we view genetic recombination When germ cells are produced in higher organisms genetic recombination assures the proper segregation of like chromosomes In the course of that process called meiosis recombination not only assures segregation of one chromosome of each type to progeny germ cells but also further shuffles the genetic deck contributing to the unique inheritance of individuals In a nutshell that is the classical view of recombination We have also known for many years that in bacteria recombination plays a role in horizontal gene transfer and in replication itself the latter by establishing some of the replication forks that are the structural scaffolds for copying DNA In recent years however we have become increasingly aware that replication which normally starts without any help from recombination is a vulnerable process that frequently leads to broken DNA The enzymes of recombination play a vital role in the repair of those breaks The recombination enzymes can function via several different pathways that mediate the repair of breaks as well as restoration of replication forks that are stalled by other kinds of damage to DNA Thus to the classical view of recombination as an engine of inheritance we must add the view of recombination as a vital housekeeping function that repairs breaks suffered in the course of replication We have also known for many years that genomic instability including mutations chromosomal rearrangements and aneuploidy is a hallmark of cancer cells Although genomic instability has many contributing causes including faulty replication there are many indications that recombination faulty or not contributes to genome instability and cancer as well The Nas colloquium *Links Between Recombination and Replication* Vital Roles of Recombination was convened to broaden awareness of this evolving area of research Papers generated by this colloquium are published here To encourage the desired interactions of

specialists we invited some contributions that deal only with recombination or replication in addition to contributions on the central thesis of functional links between recombination and replication To aid the nonspecialist and specialist alike we open the set of papers with a historical overview by Michael Cox and we close the set with a commentary on the meeting and the field by Andrei Kuzminov

A Low-Cost Approach to PCR Eva Harris, 1998-12-31 The polymerase chain reaction PCR is a technique used to replicate specific pieces of DNA millions of times which permits the detection and analysis of minute amounts of nucleic acids Since its introduction in the late 1980s this technique has been applied not only in molecular biology research but also in fields as diverse as anthropology phylogeny and forensics However despite the large impact of PCR many of its applications remain within the confines of research and the academic environment Now in *A Low Cost Approach to PCR* Appropriate Transfer of Biomolecular Techniques Dr Eva Harris makes this elegantly simple technique more accessible to researchers physicians and laboratory workers throughout the world She provides a description of the theoretical basis of the technique the practical details of the method and the philosophy behind the technology transfer program that she developed over the last ten years The book serves as a guide for potential users in developing countries and for scientists in developed countries who may wish to work abroad In addition the low cost approach outlined in this book can be useful for high school undergraduate or continuing education programs in the United States While the specific applications of PCR outlined in the book are immediately useful to the study of infectious diseases the approach presented can be generalized to a number of other technologies and situations The book will help laboratories in many areas of the world generate information on site for use by physicians epidemiologists public health workers and health policy professionals to develop new strategies for disease control

Methods, Models, Simulations And Approaches Towards A General Theory Of Change - Proceedings Of The Fifth National Conference Of The Italian Systems Society Gianfranco Minati, Mario Abram, Eliano Pessa, 2012-03-27 The book contains the Proceedings of the 2010 Conference of the Italian Systems Society Papers deal with the interdisciplinary study of processes of changing related to a wide variety of specific disciplinary aspects Classical attempts to deal with them based on

generalising approaches used to study the movement of bodies and environmental influence have included ineffective reductionistic simplifications. Indeed, changing also relates for instance to processes of acquisition and varying properties such as for software growing and aging biological systems, learning cognitive systems and socio-economic systems growing and developing through innovations. Some approaches to modelling such processes are based on considering changes in structure e.g. phase transitions. Other approaches are based on considering 1 periodic changes in structure as for processes of self-organisation, 2 non-periodic but coherent changes in structure as for processes of emergence, 3 the quantum level of description. Papers in the book study the problem considering its transdisciplinary nature i.e. systemic properties studied *per se* and not within specific disciplinary contexts. The aim of these studies is to outline a transdisciplinary theory of change in systemic properties. Such a theory should have simultaneous corresponding and eventually hierarchical disciplinary aspects as expected for a general theory of emergence. Within this transdisciplinary context, specific disciplinary research activities and results are assumed to be mutually represented as within a philosophical and conceptual framework based on the theoretical centrality of the observer and conceptual non-separability of context and observer related to logically open systems and Quantum Entanglement. Contributions deal with such issues in interdisciplinary ways considering theoretical aspects and applications from Physics, Cognitive Science, Biology, Artificial Intelligence, Economics, Architecture, Philosophy, Music and Social Systems.
