Martins, Tony Gorschek, 2022-09-01 Safety Critical Systems (SCS) are increasingly present in people's daily activities. In the means of transport in medical treatments in industrial processes in the control of air land maritime traffic and many other situations we use and depend on SCS. The requirements engineering of any system is crucial for the proper development of the same and it becomes even more relevant for the development of SCS. Requirements Engineering is a discipline that focuses on the development of techniques methods processes and tools that assist in the design of software and systems covering the activities of elicitation analysis modeling and specification validation and management of requirements. The complete specification of system requirements establishes the basis for its architectural design. It offers a description of the functional and quality aspects that should guide the implementation and system evolution. In this book we discuss essential elements of requirements engineering applied to SCS such as the relationship between safety hazard analysis and requirements specification a balance between conservative and agile methodologies during SCS development the role of requirements engineering in safety cases and requirements engineering maturity model for SCS. This book provides relevant insights for professionals students and researchers interested in improving the quality of the SCS development process making system requirements a solid foundation for improving the safety and security of future systems. **NASA Formal Methods** Julia M. **Safety for Future Transport and Mobility** Hans-Leo Ross, 2020-09-17 The book provides background information about technical solutions processes and methodology to develop future automated mobility solutions Beginning from the legal requirements as the minimum tolerable risk level of the society the book provides state of the art risk management methodologies The system engineering approach based on today's engineering best practices enhanced by

principles derived from cybernetics The approach derived from the typical behaviour of a human driver in public road traffic to a cybernetical based system engineering approach Beyond the system engineering approach a common behaviour model for the operational domain will show aspects how to extend the system engineering model with principles of cybernetics The role and the human factors of road traffic participants and drivers of motor vehicles are identified and several viewpoints for different observers show how such mixed traffic scenarios could be assessed and optimised The influence of the changing mobility demands of the society and the resulting changes to the origination of producer owner driver and supplier show aspects for future liability and risk share option for new supply chains Examples from various industries provide some well proven engineering principles how to adapt those for the future mobility for the benefit of the users The aim of the book is to raise awareness that the safety provided by a product a means of transport or a system up to an entire traffic system depends on the capabilities of the various actors In addition to the driver and passengers there are also other road users maintenance personnel and service providers who must have certain abilities to act safely in traffic These are also the capabilities of the organisation not only the organisation that develops or brings the product to market but also the organisation that is responsible for the operation and the whole lifecycle of the products The book is for people who want to get involved in the mobility of the future People that have ideas to become a player who want to help shape the future mobility of society and who want to bring responsible solutions for users into the market
