## Abstract

**Background:** Psychiatric complaints are common among primary care patients, with depression and anxiety being the most frequent. Diagnosis of anxiety and depression can be difficult, potentially leading to over- as well as under-diagnosis. The diagnostic process can be facilitated by incorporating structured interviews as part of the assessment. One such instrument, the Mini-International Neuropsychiatric Interview (MINI), has been established and accepted in psychiatric care. The purpose of this study was to explore the experiences and perceptions of the paper-and-pen version of MINI version 6.0 among patients and staff in primary care centers in Sweden.

**Methods:** The MINI was introduced at three primary care centers and was conducted by either therapists or general practitioners. Patients presented with symptoms that could suggest depression or anxiety disorders. The duration of the interview was recorded. The experiences and perceptions of 125 patients and their interviewers were collected using a structured questionnaire. Global satisfaction was measured with a visual-analog scale (0–100). Semi-structured interviews were conducted with 24 patients and three therapists, and focus groups were held with 17 general practitioners. Qualitative content analysis was used for the interviews and focus groups. The findings across the groups were triangulated with results from the questionnaires.

**Results:** The median global satisfaction with the MINI was 80 for patients and 86 for interviewers. General practitioners appreciated that the MINI identified comorbidities, as one-third of the patients had at least two psychiatric diagnoses. The MINI helped general practitioners attain a more accurate diagnosis. Patients appreciated that the MINI helped them recognize and verbalize their problems and did not find it intrusive. Patients and interviewers had mixed experiences with the yes-no format of the MINI, and the risk of subjective interpretations was acknowledged. Patients, general practitioners and therapists stated that the MINI contributed to appropriate treatment. The MINI assessment lasted 26 min on average (range 12 to 60 min).

**Conclusions:** The paper-and-pen version of the MINI could be useful in primary care as part of the clinical assessment of patients with problems suggestive of depression or anxiety disorders. The MINI was well accepted by patients, general practitioners and therapists.

Der Gesetzgeber hat mit der Einführung der neuen Approbationsordnung für Psychotherapie 2020 der Orientierung an Leitlinien im Rahmen der fünf Stationen, die in der Parcoursprüfung zum Gegenstand gemacht wurden, besonderen Stellenwert eingeräumt. offers a concise summary of key evaluations that you can easily incorporate into your daily practice. The measures will enhance the quality of patient care assisting you both in diagnosis and assessment of outcomes. Comprising a wide range of methods available for assessing persons with mental health problems, the Handbook contains more than 275 rating methods from the Abnormal Involuntary Movement Scale to the Zung Self Rating Depression Scale. In this fully revised edition, more than 40 measures have been added both to the book and to the accompanying CD ROM. The Handbook features thoroughly examined and revised measures that provide the most relevant and timely information for clinicians. New measures that empirically provide better patient evaluation. Updated costs, translations, and contact information for each measure. This handy compendium includes both diagnostic tools and measures of symptoms, function, and quality of life, medication side effects, and other clinically relevant parameters. It focuses on measures that can be most readily used in either clinical practice or research. Most of the measures are designed to improve the reliability and validity of patient assessment over what might be accomplished in a standard clinical interview. The measures also demonstrate that the use of formal measures can improve the collection, synthesis, and reporting of information as compared with the use of unstructured examinations. Seventeen disorder-specific chapters, organized in DSM-IV-TR order, include measures for Disorders of childhood and adolescence, Cognitive disorders, Sexual dysfunction, Eating disorders, Sleep disorders, Aggression, and much more. The discussion of each measure includes goals, description, practical issues, psychometric properties, and clinical utility, followed by references and suggested readings. This revised edition includes updated measure descriptions, new measure variants, and research, and newly selected measures particularly appropriate to the domain of discussion. As a clinical tool, this book describes how, when, and to what purpose measures are used. Points out practical issues to consider in choosing a measure for clinical use. Addresses limitations in the use of measures, including ethnic, cultural, and socioeconomic factors that influence their interpretation. Use of this special resource is further enhanced by a CD ROM containing the full text of more than 150 of these measures, an invaluable aid for reference and clinical decision making.
