Nonlinear Dynamical Systems in Economics Marji Lines, 2007-03-23 Many problems in theoretical economics are mathematically formalized as dynamical systems of difference and differential equations In recent years a truly open approach to studying the dynamical behavior of these models has begun to make its way into the mainstream That is economists formulate their hypotheses and study the dynamics of the resulting models rather than formulating the dynamics and studying hypotheses that could lead to models with such dynamics This is a great progress over using linear models or using nonlinear models with a linear approach or even squeezing economic models into well studied nonlinear systems from other fields There are today a number of economic journals open to publishing this type of work and some of these have become important There are several societies which have annual meetings on the subject and participation at these has been growing at a good rate And of course there are methods and techniques available to a more general audience as well as a greater availability of software for numerical and graphical analysis that makes this type of research even more exciting The lecturers for the Advanced School on Nonlinear Dynamical Systems in Economics who represent a wide selection of the research areas to which the theory has been applied agree on the importance of simulations and computer based analysis The School emphasized computer applications of models and methods and all contributors ran computer lab sessions

Mathematics of Financial Markets Jaksa Cvitanic, Fernando Zapatero, 2004-02-27 An innovative textbook for use in advanced undergraduate and graduate courses accessible to students in financial mathematics financial engineering and economics Introduction to the Economics and Mathematics of Financial Markets fills the longstanding need for an accessible yet serious textbook treatment of financial economics The book provides a rigorous overview of the subject while its flexible presentation makes it suitable for use with different levels of undergraduate and graduate students Each chapter presents mathematical models of financial problems at three different degrees of sophistication single period multi period and continuous time The single period and multi period models require only basic calculus and an introductory probability statistics course while an advanced undergraduate course in probability is helpful in understanding the continuous time models In this way the material is given complete coverage at different levels the less advanced student can stop before the more sophisticated mathematics and still be able to grasp the general principles of financial economics The book is divided into three parts The first part provides an introduction to basic securities and financial market organization the concept of interest rates the main mathematical models and quantitative ways to measure risks and rewards The second part treats option pricing and hedging here and throughout the book the authors emphasize the Martingale or probabilistic approach Finally the third part examines equilibrium models a subject often neglected by other texts in financial mathematics but included here because of the qualitative insight it offers into the behavior of market participants and pricing Economics, Social Science and Pluralism Victor A. Beker, 2022-06-08 In the work of most classical economists including Smith and Keynes theory was often embedded in application But from the second half of the last century on mainstream economics styled itself as pure economics where the theory is presented in a very abstract form detached from any application This book

maintains that economics is a social science whose mission is to explain and when possible predict phenomena of the real world economy. The book argues that the first step to restoring economics as a social science is to define what issues economics should address. Only after this research agenda is established should the appropriate methodology be chosen, not the other way around. In this respect, examples from other social sciences as well as from natural sciences are considered more appropriate models for economics rather than physics. Moreover, the need for a closer interaction with psychology, sociology and other social sciences is required to restore the discipline to that field instead of acting as a branch of applied mathematics. The book also argues for a more pluralist approach to economic education to enable prospective economists to understand real world economic phenomena and potential policy solutions. For this reason, a good economics education should necessarily include the study of economic history and of the institutional environment. This book is essential reading for anyone who wants to see economics return to its origins as a social science.

Dynamic General Equilibrium Modelling
Burkhard Heer, Alfred Maussner, 2005-01-11. Modern business cycle theory and growth theory uses stochastic dynamic general equilibrium models. Many mathematical tools are needed to solve these models. The book presents various methods for computing the dynamics of general equilibrium models. In part I, the representative agent stochastic growth model is solved with the help of value function iteration, linear and linear quadratic approximation methods, parameterised expectations and projection methods. In order to apply these methods, fundamentals from numerical analysis are reviewed in detail. Part II discusses methods for solving heterogeneous agent economies. In such economies, the distribution of the individual state variables is endogenous. This part of the book also serves as an introduction to the modern theory of distribution economics. Applications include the dynamics of the income distribution over the business cycle or the overlapping generations model. Through an accompanying home page to this book, computer codes for all applications can be downloaded.

[Introduction to Computational Economics Using Fortran](#)
Hans Fehr, Fabian Kindermann, 2018. Introduction to Computational Economics Using Fortran is the essential guide to conducting economic research on a computer. Aimed at students of all levels of education as well as advanced economic researchers, it facilitates the first steps into writing programs using Fortran. Introduction to Computational Economics Using Fortran assumes no prior experience as it introduces the reader to this programming language. It shows the reader how to apply the most important numerical methods conducted by computational economists using the toolbox that accompanies this text. It offers various examples from economics and finance organized in self-contained chapters that speak to a diverse range of levels and academic backgrounds. Each topic is supported by an explanation of the theoretical background, a demonstration of how to implement the problem on the computer, and a discussion of simulation results. Readers can work through various exercises that promote practical experience and deepen their economic and technical insights. This textbook is accompanied by a website from which readers can download all program codes as well as a numerical toolbox and receive technical information on how to install Fortran on

their computer Nonlinear Dynamics and Heterogeneous Interacting Agents Thomas Lux, Stefan Reitz, Eleni Samanidou, 2005-02-11 Economic application of nonlinear dynamics microscopic agent based modelling and the use of artificial intelligence techniques as learning devices of boundedly rational actors are among the most exciting interdisciplinary ventures of economic theory over the past decade This volume provides us with a most fascinating series of examples on complexity in action exemplifying the scope and explanatory power of these innovative approaches **Machine Learning Perspectives of Agent-Based Models** Pedro Campos, Anand Rao, Joaquim Margarido, 2025-09-19 This book provides an overview of agent based modeling ABM and multi agent systems MAS emphasizing their significance in understanding complex economic systems with a special focus on the emerging properties of heterogeneous agents that cannot be deduced from the characteristics of individual agents ABM is highlighted as a powerful tool for studying economics especially in the context of financial crises and pandemics where traditional models such as dynamic stochastic general equilibrium DSGE models have proven inadequate Containing numerous practical examples and applications with R Python Julia and Netlogo the book explores how learning particularly machine learning can be integrated into multi agent systems to enhance the adaptation and behavior of agents in dynamic environments It compares different learning approaches including game theory and artificial intelligence highlighting the advantages of each in modeling economic phenomena Dynamic Social Networks in Agent-based Modelling Holzhauer, Sascha, 2017 Agent based modelling enables the explicit representation of entities and their interaction with each other and the environment and so it became an important method to study complex systems Social networks form an important part of agent based social simulation as they define the topology of agent interaction This dissertation initially identifies important properties of social networks and their dynamics and reviews their representation in agent based models of relevant domains A classification of levels of detail for the network modelling components initialisation dynamics of networks and dynamics on networks is proposed and guides the identification of deficits A formal iterative evaluation framework is developed to quantitatively assess network modelling approaches under a set of weighted criteria representativity adjustability validity and efficiency The framework is applied to an abstract model of opinion dynamics and to an empirically grounded model of social influence A lifestyle specific network survey is designed conducted and analysed and helps to ground the evaluation of the network modelling's representativity on empirical data The study finds significant differences of degree and distance distributions as well as in the composition of ego networks between lifestyles New network modelling approaches are developed to account for requirements in agent based models such as agent type specific link preferences degree and distance distributions community structures and interaction dynamics The comparison of simple to elaborated network modelling for the application models shows a significant impact on simulation results highlighting the need for informed decisions about suitable approaches **Dynamic General Equilibrium Modeling** Burkhard Heer, Alfred Maussner, 2011-10-20 Modern business cycle theory and growth theory uses

stochastic dynamic general equilibrium models In order to solve these models economists need to use many mathematical tools This book presents various methods in order to compute the dynamics of general equilibrium models In part I the representative agent stochastic growth model is solved with the help of value function iteration linear and linear quadratic approximation methods parameterised expectations and projection methods In order to apply these methods fundamentals from numerical analysis are reviewed in detail In particular the book discusses issues that are often neglected in existing work on computational methods e g how to find a good initial value In part II the authors discuss methods in order to solve heterogeneous agent economies In such economies the distribution of the individual state variables is endogenous This part of the book also serves as an introduction to the modern theory of distribution economics Applications include the dynamics of the income distribution over the business cycle or the overlapping generations model In an accompanying home page to this book computer codes to all applications can be downloaded

Agent-based Modeling and Network Dynamics Akira Namatame, Shu-Heng Chen, 2016 The book integrates agent based modeling and network science It is divided into three parts namely foundations primary dynamics on and of social networks and applications The authors begin with the network origin of agent based models known as cellular automata and introduce a number of classic models such as Schelling's segregation model and Axelrod's spatial game The text shows that the modern network science mainly driven by game theorists and sociophysicists has inspired agent based social scientists to develop alternative formation algorithms known as agent based social networks

Ontology, Epistemology, and Teleology for Modeling and Simulation Andreas Tolk, 2012-08-10 In this book internationally recognized experts in philosophy of science computer science and modeling and simulation are contributing to the discussion on how ontology epistemology and teleology will contribute to enable the next generation of intelligent modeling and simulation applications It is well understood that a simulation can provide the technical means to display the behavior of a system over time including following observed trends to predict future possible states but how reliable and trustworthy are such predictions The questions about what we can know ontology how we gain new knowledge epistemology and what we do with this knowledge teleology are therefore illuminated from these very different perspectives as each expert uses a different facet to look at these challenges The result of bringing these perspectives into one book is a challenging compendium that gives room for a spectrum of challenges from general philosophy questions such as can we use modeling and simulation and other computational means at all to discover new knowledge down to computational methods to improve semantic interoperability between systems or methods addressing how to apply the recent insights of service oriented approaches to support distributed artificial intelligence As such this book has been compiled as an entry point to new domains for students scholars and practitioners and to raise the curiosity in them to learn more to fully address the topics of ontology epistemology and teleology from philosophical computational and conceptual viewpoints
