ABSTRACT

The design of hydrocarbon gas detection systems using risk analysis methods is drawing a lot of attention because industry experts have come to a consensus that design codes used in traditional gas detection system design work are not sufficient for open-door process areas having serious hazards, such as fire, flammable gas and toxic gas. The ISA Technical Report TR 84.00.07 provides guidelines for the design of fire and gas systems in un-enclosed process areas in accordance with the principles given in IEC 61511 standards. This paper presents an overview of the design of gas detection systems using risk assessment methods that are described in the ISA technical report. These methods are statistical in nature and are used to assign and verify targets for the performance metrics (detector coverage and safety availability) of gas detection systems. This paper also provides an overview of the performance based safety life cycle of gas detection systems from conceptual design stage to operations and maintenance.

1. INTRODUCTION

Risk assessment techniques are being increasingly used in the design of engineered safeguards, such as Fire and Gas Detection and Suppression Systems (FGS), Safety Instrumented Systems (SIS) and Alarm Systems. The principles of risk assessment used in the design of SIS can also be used in the design of Gas Detection Systems. A Gas Detection System is a type of instrumented safeguard intended to reduce risks posed by process plants, such as safety risk, environmental risk, and asset risk (commercial/business) to tolerable levels. However, gas detection systems are only capable of mitigating the consequence of a loss of containment, whereas safety instrumented systems are capable of preventing the consequence from occurring altogether.

All automated safety systems such as FGS, SIS, and High Integrity Pressure Protection Systems (HIPS) need a "basis of safety" for the selection and design of its functional elements (sensor, logic solver and final control elements). In the design of Gas Detection Systems, it is important to select detectors of the appropriate technology and care must be taken to position the right number of detectors at the correct location for the system to respond on demand. In addition, the basis of safety specifies the mechanical integrity requirements for the equipment with respect to the type and frequency of preventive maintenance tasks required. In short, the basis of safety is at the core of decisions that are made with reference to selection and maintenance of instruments.

The two options for choosing basis of safety are – prescriptive and performance-based. Prescriptive basis of safety (such as NFPA 72 and EN 54 for fire alarming equipment) specifies the type of equipment, its location for installation and also addresses the requirements to maintain them. Not only do the prescriptive standards for FGS design provide a very comprehensive set of
