

During the negative half cycle of the supply, diodes D3 and D4 conduct in series, but diodes D1 and D2 switch “OFF” as they are now reverse biased. The current flowing through the load is the same direction as before.

The Negative Half-cycle

In subsequent Half cycles of the AC Current the above process are repeated. In both the half cycles it is clear that current flows through the resistor in only one direction. Even though the voltage across load is unidirectional it will still contains a few AC components. This is filtered and made smooth using a capacitor, which filters 99% of the AC current. A resistor is then used to adjust the output voltage. Capacitor also nearly filters all AC components from supply and resistance is adjusted for the required output. As this is a simple circuit, two capacitors and one resistor are being used. The output Direct Current and voltage light up the LED and other source connected with it.

Three-Phase Diode Rectifiers with Low Harmonics Predrag Pejovic,2007-07-31 This book reviews numerous research papers published in the last fifteen years in the area of current injection based rectifiers A partial list of coverage includes analysis of various magnetic current injection devices the third harmonic current injection injection networks and optimal current injection The book will be of interest to professionals involved in design of low harmonic three phase rectifiers as well as students and researchers

Advanced Power Rectifier Concepts B. Jayant Baliga,2009-06-16 During the last decade many new concepts have been proposed for improving the performance of power rectifiers and transistors The results of this research are dispersed in the technical literature among journal articles and abstracts of conferences Consequently the information is not readily available to researchers and practicing engineers in the power device community There is no cohesive treatment of the ideas to provide an assessment of the relative merits of the ideas

Advanced Power Rectifier Concepts provides an in depth treatment of the physics of operation of advanced power rectifiers. Analytical models for explaining the operation of all the advanced power rectifier devices will be developed. The results of numerical simulations will be provided to provide additional insight into the device physics and validate the analytical models. The results of two dimensional simulations will be provided to corroborate the analytical models and provide greater insight into the device operation.
