Electronic Properties of Materials
 Rolf E. Hummel, 2012-12-06 Books are seldom finished At best they are abandoned The second edition of Electronic Properties of Materials has been in use now for about seven years During this time my publisher gave me ample opportunities to update and improve the text whenever the Ibook was reprinted There were about six of these reprinting cycles Eventually however it became clear that substantially more new material had to be added to account for the stormy developments which occurred in the field of electrical optical and magnetic materials In particular expanded sections on flat panel displays liquid crystals electroluminescence devices field emission displays and plasma displays were added Further the recent developments in blue and green emitting LED s and in photonics are included Magnetic storage devices also underwent rapid development Thus magneto optical memories magneto resistance devices and new magnetic materials needed to be covered The sections on dielectric properties ferroelectricity piezoelectricity electrostriction and thermoelectric properties have been expanded Of course the entire text was critically reviewed updated and improved However the most extensive change I undertook was the conversion of all equations to SI units throughout In most of the world and in virtually all of the international scientific journals use of this system of units is required If today's students do not learn to utilize it another generation is lost on this matter In other words it is important that students become comfortable with SI units
