PIPE FITTING FRICTION CALCULATION

The friction loss for fittings depends on a K factor which can be found in many sources such as the Crane's Hydraulic data book or the Hydraulic Institute Engineering data book, the charts which it represents found in Figures 1 and 2.

The fitting friction ΔH_f can be calculated based on the following formula where K is a factor based on the type of fitting, v is the velocity in feet/second, g is the acceleration due to gravity (32.17 ft/s^2).

$$\Delta H_f = K \left(\frac{v^3}{2g} \right) \quad \text{feet}$$

For example a 2" iron screwed elbow has a K factor of 0.85 according to Figure 1 and using a velocity of 10 fps (this is determined from the flow rate). The fitting friction loss will be:

$$\Delta H_f = K \left(\frac{v^3}{2g} \right) = 0.85 \left(\frac{10^3}{2 \times 32.17} \right) = 1.3$$
