

# Photoelectric Effect Virtual Lab

Name: \_\_\_\_\_

Date: \_\_\_\_\_

**Objective:** To investigate the photoelectric effect and to determine the effect that the wavelength of the light, the intensity of the light and the type of metal have on the resulting current.

**Apparatus:** Computer and the following website:

<https://phet.colorado.edu/en/simulation/photoelectric>

## Procedure:

1. Go the to the webpage above for the photo effect simulation.
2. Click on the Run Now! Button to launch the simulation.
3. You should see the picture below:

4. This is a simulation of the photoelectric effect device that was used to measure Planck's constant and to determine the work function of different metals.
  - a. The Light source at the top will shine a variable "light" down on the metal.
    1. You can change the intensity and wavelength of the light by sliding the appropriate buttons or you can get more specific by typing in the box the exact intensity or wavelength you want.
  - b. When the light is turned on and the wavelength is low enough electrons will be ejected off of the metal and go across the gap to the other piece of metal.
    1. If enough electrons move across the gap an electric current will be generated which is measured in the box labeled current.
