algorithms and are useful in some circumstances. We can think of a search tree as a backward-chaining search using **depth-first search**. That is, starting with the goal, we first go down the leftmost branch, then up, then down the next branch, and so on, until we reach the root. This is the approach taken by **depth-first programming** systems, which can achieve strong and useful performance in certain circumstances. Using logic programming combines the good ideas of backward-chaining with the forward-programming efficiency of forward-chaining. It is also simpler, the branching search tree, which means that the programmer need not write too much extra code. It is well suited to get an initial idea, and produces the **bottom-up** flow that often is a powerful optimization method in logic.

9.4.2 Bottom-up execution of Prolog

Prolog uses bottom-up execution, as discussed in Section 9.4.1. The search tree is constructed from the root. Prolog constructs and uses ground nodes rather than variable objects, and the closed world assumption says that the only solutions that can be seen are those that are explicitly
