Emergent Conditions Limin Jia, Li Wang, Yong Qin, 2021-07-17 This book addresses the current development status of high speed railways globally and analyzes their operational schemes and practices under emergent conditions. It covers methods and problem solving philosophy with regard to complexity analysis, capacity evaluation, passenger flow forecasts, operating strategies, passenger flow allocation, resource allocation, and supporting technologies in the context of serious accidents and adverse environmental influences on train operation and service organization of high speed railways. The abnormal scenarios, emergent conditions, adverse events, and corresponding theoretical and applicational solutions dealing with the train operation both in line and network scale are all from real world cases related to and designed for Chinese high speed railway network which is the largest in scale, the highest in complexity, and the most difficult in tackling with the complex and diverse climate and geographical environment, and thus makes the book both theoretically rigorous and practically applicable. It not only helps readers consider the train and network interactions from the perspective of complexity science but also provides them with a philosophical framework and approaches available to construct their own roadmap and problem solving paradigms in their daily research or management. This book is suitable for researchers, postgraduates, and managerial and engineering practitioners in railway related fields, especially in high speed railway operation and emergency management.

Foundations of Software Technology and Theoretical Computer Science S.N. Maheshwari, 1985-11 *Parallel Computing in Optimization* A. Migdalas, Panos M. Pardalos, Sverre Storøy, 2013-12-01 During the last three decades, breakthroughs in computer technology have made a tremendous impact on optimization. In particular, parallel computing has made it possible to solve larger and computationally more difficult problems. This volume contains mainly lecture notes from a Nordic Summer School held at the Linköping Institute of Technology, Sweden, in August 1995. In order to make the book more complete, a few authors were invited to contribute chapters that were not part of the course on this first occasion. The purpose of this Nordic course in advanced studies was three fold. One goal was to introduce the students to the new achievements in a new and very active field, bring them close to world leading researchers, and strengthen their competence in an area with an internationally explosive rate of growth. A second goal was to strengthen the bonds between students from different Nordic countries and to encourage collaboration and joint research ventures over the borders. In this respect, the course built further on the achievements of the Nordic Network in Mathematical Programming, which has been running during the last three years with the support of the Nordic Council for Advanced Studies, NorFA. The final goal was to produce literature on the particular subject which would be available to both the participating students and to the students of the next generation.

Parallel Sorting Algorithms Selim G. Akl, 2014-06-20 Parallel Sorting Algorithms explains how to use parallel algorithms to sort a sequence of items on a variety of parallel computers The book reviews the sorting problem the parallel models of computation parallel algorithms and the lower bounds on the parallel sorting problems The text also presents twenty different algorithms such as linear arrays mesh connected computers cube connected computers Another example where algorithm can be applied is on the shared memory SIMD single instruction stream multiple data stream computers in which the whole sequence to be sorted can fit in the respective primary memories of the computers random access memory or in a single shared memory SIMD processors communicate through an interconnection network or the processors communicate through a common and shared memory The text also investigates the case of external sorting in which the sequence to be sorted is bigger than the available primary memory In this case the algorithms used in external sorting is very similar to those used to describe internal sorting that is when the sequence can fit in the primary memory The book explains that an algorithm can reach its optimum possible operating time for sorting when it is running on a particular set of architecture depending on a constant multiplicative factor The text is suitable for computer engineers and scientists interested in parallel algorithms
