Dynamic Light Scattering The Method And Some Applications Monographs On The Physics And Chemistry Of Materials:

Light Scattering from Polymer Solutions and Nanoparticle Dispersions Wolfgang Schärtl, 2007-08-13 Light scattering is a very powerful method to characterize the structure of polymers and nanoparticles in solution Recent technical developments have strongly enhanced the possible applications of this technique overcoming previous limitations like sample turbidity or insufficient experimental time scales However despite their importance these new developments have not yet been presented in a comprehensive form In addition and maybe even more important to the broad audience there lacks a simple to read textbook for students and non experts interested in the basic principles and fundamental techniques of light scattering As part of the Springer Laboratory series this book tries not only to provide such a simple to read and illustrative textbook about the seemingly very complicated topic of light scattering from polymers and nanoparticles in dilute solution but also intends to cover some of the newest technical developments in experimental light scattering

Dynamic Light Scattering Wyn Brown, 2023 Dynamic light scattering is one of the new methods developed for investigating macromolecular systems This book traces the recent developments in the technique and illustrates its wide variety of fundamental and practical applications

Soft and Fragile Matter Michael E. Cates, M.R Evans, 2000-01-01 Covering colloids polymers surfactant phases emulsions and granular media *Soft and Fragile Matter Nonequilibrium Dynamics Metastability and Flow* PBK provides self contained and pedagogical coverage of the rapidly advancing field of systems driven out of equilibrium with a strong emphasis on unifying conceptual principles rather than material specific details Written by internationally recognized experts the book contains introductions at the level of a graduate course in soft condensed matter and statistical physics to the following areas experimental techniques polymers rheology colloids computer simulation surfactants phase separation kinetics driven systems structural glasses slow dynamics and granular materials These topics lead to a range of exciting applications at the forefront of current research including microplasticity of emulsions sequence design of copolymers branched polymer dynamics nucleation kinetics in colloids multiscale modeling flow induced surfactant textures fluid demixing under shear two time correlation functions chaotic sedimentation dynamics and sound propagation in powders Balancing theory simulation and experiment this broadly based pedagogical account of a rapidly developing field is an excellent compendium for graduate students and researchers in condensed matter physics materials science and physical chemistry

Dynamic Light Scattering Wyn Brown, 1993-01-28 Dynamic light scattering is an experimental technique now commonly found in laboratories concerned with fundamental studies of macromolecular systems Preface

Neutron Spin Echo Spectroscopy Ferenc Mezei, Catherine Pappas, Thomas Gutberlet, 2008-01-11 Neutron spin echo NSE spectroscopy is the highest energy resolution neutron scattering technique available for examining a large area in time and space in condensed matter physics This broad dynamic and spatial range is extensively exploited in the study of a wide range of

scientific problems ranging from the dynamics of glasses polymer melts complex fluids and microemulsions to the elementary excitations in superfluid 4He and to ferromagnets and spin glasses This book reviews the current status and future prospects in NSE spectroscopy describing the method latest instrumentation and also the use of NSE in fundamental hard and soft matter science It provides first hand information for researchers working in the fields touched by NSE In addition young researchers PhD students and graduates interested in the method will obtain a comprehensive overview and guidelines to implementing the NSE technique

Optical Interferometry for Biology and Medicine David D. Nolte,2011-12-04 This book presents the fundamental physics of optical interferometry as applied to biophysical biological and medical research Interference is at the core of many types of optical detection and is a powerful probe of cellular and tissue structure in interference microscopy and in optical coherence tomography It is also the root cause of speckle and other imaging artefacts that limit range and resolution For biosensor applications the inherent sensitivity of interferometry enables ultrasensitive detection of molecules in biological samples for medical diagnostics In this book emphasis is placed on the physics of light scattering beginning with the molecular origins of refraction as light propagates through matter and then treating the stochastic nature of random fields that ultimately dominate optical imaging in cells and tissue The physics of partial coherence plays a central role in the text with a focus on coherence detection techniques that allow information to be selectively detected out of incoherent and heterogeneous backgrounds Optical Interferometry for Biology and Medicine is divided into four sections The first covers fundamental principles and the next three move up successive scales beginning with molecular interferometry biosensors moving to cellular interferometry microscopy and ending with tissue interferometry biomedical An outstanding feature of the book is the clear presentation of the physics with easy derivations of the appropriate equations while emphasizing rules of thumb that can be applied by experimental researchers to give semi quantitative predictions

Neutrons, X-rays, and Light Peter Lindner,Julian Oberdisse,2024-12-06 This book addresses the possibilities provided by scattering techniques in the study of soft matter It fills the gap between the fundamental scattering processes which are described by the general theoretical framework of elastic and quasi elastic interaction of radiation with matter and state of the art applications to specific soft matter systems Three probes are discussed in detail neutrons X ray photons and visible light The first part of the book is dedicated to the use of general principles for the measurement and

analysis of scattered intensity elementary scattering process data reduction general theorems the concept of reciprocal space and its link to structural and dynamical information in direct space In the second part methods and techniques are further discussed including resolution effects contrast variation static and dynamic light scattering quasi elastic neutron scattering and reflectometry and grazing incidence techniques Part three deals with the state of the art of scattering studies of typical soft matter systems polymers self assembled surfactant systems microemulsions liquid crystals colloids aggregates biological systems with dedicated chapters for particle interactions and modelling Part four highlights special applications from turbid media to scattering under external constraints and industrial applications This new edition written by the lecturers of the Bombannes Summer School will be most useful as a learning tool for masters and PhD students post docs and young researchers moving into the field As with the previous edition it will also be a reference for any scientist working in soft matter where scattering techniques are ubiquitous used both in small laboratories and at large scale research facilities Provides an understandable and thorough introduction to the fundamentals of scattering in a way that is accessible for students PhDs Offers a comprehensive overview of the main scattering techniques associated with neutrons X rays and light Includes chapters on virtually all soft matter systems Presents both standard analyses and recent advances in scattering techniques

The Cumulative Book Index, 1996 A world list of books in the English language American Book Publishing Record, 2004 Scientific and Technical Aerospace Reports, 1982 Lists citations with abstracts for aerospace related reports obtained from world wide sources and announces documents that have recently been entered into the NASA Scientific and Technical Information Database

Dynamic Light Scattering R. Pecora, 1985-05-31 In the twenty years since their inception modern dynamic light scattering techniques have become increasingly sophisticated and their applications have grown exceedingly diverse Applications of the techniques to problems in physics chemistry biology medicine and fluid mechanics have proliferated It is probably no longer possible for one or two authors to write a monograph to cover in depth the advances in scattering techniques and the main areas in which they have made a major impact This volume which we expect to be the first of a series presents reviews of selected specialized areas by renowned experts It makes no attempt to be comprehensive it emphasizes a body of related applications to polymeric biological and colloidal systems and to critical phenomena The well known monographs on dynamic light scattering by Berne and Pecora and by Chu were published almost ten years ago They provided comprehensive treatments of the general principles of dynamic light scattering and gave introductions to a wide variety of applications but naturally they could not treat the new applications and advances in older ones that have arisen in the last decade The new applications include studies of interacting particles in solution Chapter 4 scaling approaches to the dynamics of polymers including polymers in semidilute solution Chapter 5 the use of both Fabry Perot interferometry and photon correlation spectroscopy to study bulk polymers Chapter 6 studies of micelles and microemulsions Chapter 8 studies of polymer gels Chapter 9
