Dynamic Vision For Perception And Control Of Motion:

Dynamic Vision for Perception and Control of Motion Ernst Dieter Dickmanns, 2007-06-02 The application of machine vision to autonomous vehicles is an increasingly important area of research with exciting applications in industry defense and transportation likely in coming decades Dynamic Vision for Perception and Control of Motion has been written by the world's leading expert on autonomous road following vehicles and brings together twenty years of innovation in the field by Professor Dickmanns and his colleagues at the German Armed Forces university in Munich The book uniquely details an approach to real time machine vision for the understanding of dynamic scenes viewed from a moving platform that begins with spatio temporal representations of motion for hypothesized objects whose parameters are adjusted by well known prediction error feedback and recursive estimation techniques A coherent and up to date coverage of the subject matter is presented with the machine vision and control aspects detailed along with reports on the mission performance the first vehicles using these innovative techniques built at Munich Pointers to the future development and likely applications of this hugely important field of research are presented Dynamic Vision for Perception and Control of Motion will be a key reference for technologists working in autonomous vehicles and mobile robotics in general who wish to access the leading research in this field as well as researchers and students working in machine vision and dynamic control interested in one of the most interesting and promising applications of these techniques *The Cambridge Handbook of Artificial Intelligence* Keith Frankish, William M.

Neurovision: Neural bases of binocular vision and coordination and their implications in visual training programs Olivier A. Coubard, 2015-10-12 Binocular vision is achieved by five neurovisual systems originating in the retina but varying in their destination within the brain Two systems have been widely studied the retino tectal or retino collicular route which subserves an expedient and raw estimate of the visual scene through the magnocellular pathway and the retino occipital or retino cortical route which allows slower but refined analysis of the visual scene through the parvocellular pathway But there also exist further neurovisual systems the retino hypothalamic retino pretectal and accessory optic systems which play a crucial role in vision though they are less understood The retino pretectal pathway projecting onto the pretectum is critical for the pupillary or photomotor reflex The retino hypothalamic pathway projecting onto the suprachiasmatic nucleus regulates numerous behavioral and biological functions as well as circadian rhythms The accessory optic system targeting terminal lateral medial and dorsal nuclei through the paraoptic fasciculus plays a role in head and gaze orientation as well as slow movements Taken together these neurovisual systems involve 60% of brain activity thus highlighting the importance of vision in the functioning and regulation of the central nervous system But vision is first and foremost action which makes perception impossible without movement Binocular coordination is a prerequisite for binocular fusion of the object of interest on the two foveas thus ensuring visual perception The retino collicular pathway is

sufficient to elicit reflexive eye movements with short latencies Thanks to its motor neurons the superior colliculus activates premotor neurons which themselves activate motor neurons of the oculomotor trochlear and abducens nuclei At a higher level a cascade of neural mechanisms participates in the control of decisional eye movements The superior colliculus is controlled by the substantia nigra pars reticulata which is itself gated by subcortical structures such as the dorsal striatum The superior colliculus is also inhibited by the dorsolateral prefrontal cortex through a direct prefrontotectal tract Cortical areas are crucial for the triggering of eye movements the frontal eye field supplementary eye field and parietal eye field Finally the cerebellum maintains accuracy The focus of the present research topic entitled Neural bases of binocular vision and coordination and their implications in visual training programs is to review the most recent findings in brain imaging and neurophysiology of binocular vision and coordination in humans and animals with frontally placed eyes The emphasis is put on studies that enable transfer of knowledge toward visual training programs targeting visual field defects e g hemianopia and binocular functional disorders e g amblyopia

Advances in Cognitive Engineering and Neuroergonomics Kay Stanney, Kelly S. Hale, 2019-07-19 This volume explores cognitive ergonomics which is concerned with mental processes otherwise known as brain work It discusses perception memory reasoning and motor response as they affect interactions among humans and other elements of a system Topics will include mental workload decision making skilled performance human computer interaction human reliability work stress and training as these relate to human system design This book brings together a wide ranging set of contributed articles that address emerging practices and future trends in cognitive engineering and neuroergonomics both aim to harmoniously integrate human operator and computational system the former through a tighter cognitive fit and the latter a more effective neural fit with the system The chapters in this book uncover novel discoveries and communicate new understanding and the most recent advances in the areas of workload and stress activity theory human error and risk and neuroergonomic measures as well as associated applications

Group-Theoretical Methods in Image Understanding Ken-ichi Kanatani, 2012-12-06 Image understanding is an attempt to extract knowledge about a 3D scene from 2D images The recent development of computers has made it possible to automate a wide range of systems and operations not only in the industry military and special environments space sea atomic plants etc but also in daily life As we now try to build ever more intelligent systems the need for visual control has been strongly recognized and the interest in image understanding has grown rapidly Already there exists a vast body of literature ranging from general philosophical discourses to processing techniques Compared with other works however this book may be unique in that its central focus is on mathematical principles Lie groups and group representation theory in particular In the study of the relationship between the 3D scene and the 2D image geometry naturally plays a central role Today so many branches are interwoven in geometry that we cannot truly regard it as a single subject Nevertheless as Felix Klein declared in his Erlangen Program the central principle of geometry is group theory because geometrical concepts are abstractions of

properties that are invariant with respect to some group of transformations In this text we specifically focus on two groups of transformations One is 20 rotations of the image coordinate system around the image origin Such coordinate rotations are indeed irrelevant when we look for intrinsic image properties **Scientific and Technical Aerospace Reports** ,1987

Hurvich, 2012-12-06 This volume on Visual Psychophysics documents the current status of research aimed toward understanding the intricacies of the visual mechanism and its laws of operation in intact human perceivers As can be seen from the list of contributors the problems of vision engage the interest and experimental ingenuity of investigators from a variety of disciplines Thus we find authors affiliated with departments of biology medical and physiological physics ophthalmology physics physiology and anatomy psychology laboratories of neurophysiology medical clinics schools of optometry visual and other types of research institutes A continuing interplay between psychophysical studies and physiological work is everywhere evident As more information about the physiological basis of vision accumulates and new studies and analyses of receptor photochemistry and the neurophysiology of retina and brain appear psychophysical studies of the intact organism become more sharply focused sometimes more complex and often more specialized Technological advances have increased the variety and precision of the stimulus controls and advances in measurement techniques have reopened old problems and stimulated the investigation of new ones In some cases new concepts are being drawn in to help further our understanding of the laws by which the visual mechanism operates in other cases ideas
