

## SIEM Benchmarking Process

The matrices that follow are designed as guidelines to assist readers in setting their own benchmark requirements for SIEM system testing. While this is a benchmark checklist, readers must remember that benchmarking, itself, is governed by variables specific to each organization. For a real-life example, consider an article in eSecurity Planet, in which Aurora Health in Michigan estimated that they produced 5,000–10,000 EPS, depending upon the time of day.<sup>1</sup> We assume that means during the normal ebbs and flow of network traffic. What would that load look like if it were under attack? How many security events would an incident, such as a virus outbreak on one, two or three subnets, produce?

An organization also needs to consider their devices. For example, a Nokia high-availability firewall is capable of handling more than 100,000 connections per second, each of which could theoretically create a security event log. This single device would seem to imply a need for 100,000 minimum EPS just for firewall logs. However, research shows that SIEM products typically handle 10,000–15,000 EPS per collector.

Common sense tells us that we should be able to handle as many events as ALL our devices could simultaneously produce as a result of a security incident. But that isn't a likely scenario, nor is it practical or necessary. Aside from the argument that no realistic scenario would involve all devices sending maximum EPS, so many events at once would create bottlenecks on the network and overload and render the SIEM collectors useless. So, it is critical to create a methodology for prioritizing event relevance during times of load so that even during a significant incident, critical event data is getting through, while ancillary events are temporarily filtered.

Speed of hardware, NICs (network interface cards), operating systems, logging configurations, network bandwidth, load balancing and many other factors must also go into benchmark requirements. One may have two identical server environments with two very different EPS requirements due to any or all of these and other variables. With consideration of these variables, EPS can be established for normal and peak usage times. We developed the equations included here, therefore, to determine Peak Events (PE) per second and to establish normal usage by exchanging the PE<sub>n</sub> for NE<sub>n</sub> (Normal Events per second).

List all of the devices in the environment expected to report to the SIEM. Be sure to consider any planned changes, such as adding new equipment, consolidating devices, or removing end of life equipment.

### **Analyse sicherheitsrelevanter Geschäftsprozesse eines Anwendungsfalls aus der Finanzbranche und Ermittlung der hierfür geeigneten Methoden**

Peter von Oppenkowski, 2011-11-29 Inhaltsangabe Einleitung Die Informationstechnologie IT hat in den Finanzdienstleistungsbereichen schon lange einen bergreifenden Einzug erhalten und unterstützt Kunden sowie Mitarbeiter bei täglichen Routinen. Der Einsatz von mobilen und stark vernetzten IT-Systemen ist dabei in nahezu sämtlichen Geschäftsprozessen wiederzufinden und leistet als Rückgrat vieler Geschäftsmodelle einen wesentlichen Beitrag zur Erreichung der Unternehmensziele. Immer deutlicher zeigt die dabei eingesetzte IT-Infrastruktur zum wertvollen, besonders zu schätzenden Gut eines Unternehmens und ist zugleich zunehmend dem Einwirken komplexer Ereignisse resultierend aus Missbräuchen oder auch Fehlbedienungen auf sicherheitskritische Eigenschaften der Geschäftsprozesse ausgesetzt. Für die Finanzbranche entstehen auf diese Weise Schäden, die sehr vielfältig ausfallen können und dessen vorläufiger Höhepunkt sich verursacht durch einen einzelnen Fall von Computermissbrauch auf eine bedrohliche Schadenssumme von 4,9 Milliarden Euro beläuft. Der IT-Sicherheit wird damit eine enorme Bedeutung zuteil, dessen Erfolg gemessen an der Minimierung der Gefährdung des reibungslosen Geschäftsablaufs bzw. der Vermeidung wirtschaftlicher Schäden wesentlich von der effizienten Ermittlung und Bewertung von Bedrohungen und Risiken und anschließender Maßnahmen abhängt. Dem wird die Sicherheitsanalyse, deren Ergebnisse sich in den Sicherheitsanforderungen widerspiegeln, gerecht. Die allerdings aufgrund der Dynamik bei IT-Systemen bereits einen stetig wiederkehrenden Aufwand für das Unternehmen bedeutet. Zusätzlich und weitaus aufwendiger ergibt sich die Durchführung und Überwachung der aus den Anforderungen hervorgehenden Sicherheitsmaßnahmen im Tagesgeschäft. Um diesen Aufgaben Herr zu werden, bedienen sich Finanzdienstleister FDL technischer Hilfsmittel, dessen Leistungsfähigkeit einen gewichtigen Einflussfaktor auf ein optimales Verhältnis zwischen höchstmöglichem Schutz bei geringstmöglichem Arbeitsaufwand ausmacht. Zu den von den FDL genutzten technischen Hilfsmitteln zählen unter anderem Firewalls, Virens Scanner, Intrusion Detection bzw. Intrusion Protection Systeme (IDS/IPS), die im Wesentlichen sicherheitskritische Aktivitäten innerhalb eines Rechnernetzes oder Systems erkennen bzw. anzeigen und ggf. unterbinden sowie zunehmend Security Information and Event Management (SIEM) Lösungen. Letztere nehmen eine bergeordnete Rolle ein, da diese auf erstgenannte aufsetzen.

*The Cyber Security Network Guide*  
Fiedelholz, 2020-11-11 This book presents a unique step by step approach for monitoring, detecting, analyzing and mitigating complex network cyber threats. It includes updated processes in response to asymmetric threats as well as descriptions of the current tools to mitigate cyber threats. Featuring comprehensive computer science material relating to a complete network baseline with the characterization hardware and software configuration, the book also identifies potential emerging cyber threats and the vulnerabilities of the network architecture to provide students with a guide to responding to threats. The book is intended for undergraduate and graduate college students who are unfamiliar with the cyber paradigm and processes in
