**Ontology-Based Development of Industry 4.0 and 5.0 Solutions for Smart Manufacturing and Production** János Abonyi, László Nagy, Tamás Ruppert, 2024-01-01 This book presents a comprehensive framework for developing Industry 4.0 and 5.0 solutions through the use of ontology modeling and graph based optimization techniques. With effective information management being critical to successful manufacturing processes this book emphasizes the importance of adequate modeling and systematic analysis of interacting elements in the era of smart manufacturing. The book provides an extensive overview of semantic technologies and their potential to integrate with existing industrial standards planning and execution systems to provide efficient data processing and analysis. It also investigates the design of Industry 5.0 solutions and the need for problem specific descriptions of production processes operator skills and states and sensor monitoring in intelligent spaces. The book proposes that ontology based data can efficiently represent enterprise and manufacturing datasets. The book is divided into two parts modeling and optimization. The semantic modeling part provides an overview of ontologies and knowledge graphs that can be used to create Industry 4.0 and 5.0 applications with two detailed applications presented on a reproducible industrial case study. The optimization part of the book focuses on network science based process optimization and presents various detailed applications such as graph based analytics assembly line balancing and community detection. The book is based on six key points: the need for horizontal and vertical integration in modern industry; the potential benefits of integrating semantic technologies into ERP and MES systems; the importance of optimization methods in Industry 4.0 and 5.0 concepts; the need to process large amounts of data while ensuring interoperability and reusability factors; the potential for digital twin models to model smart factories including big data access; and the need to integrate human factors in CPSs and provide adequate methods to facilitate collaboration and support shop floor workers.

*Interoperability Principles and Standards: Applications to Collaborative and Automated Systems* François Vernadat, Arturo Molina, Hervé Panetto, Georg Weichhart, 2025-03-19 Interoperability is the ability for two or more systems to interoperate i.e. to share and use common information and/or to use functionality of one another. The purpose of the book is to explain what one should know to be able to understand or implement systems interoperability at the technical semantic and organization levels of an enterprise system or of a collaborative automated system. In particular it presents the rationale the basics the common methods and the essential standards for the engineering of interoperable systems. The book is intended to serve as a textbook for those who need 1) to study basic principles concepts and techniques along with applications of systems interoperability and 2) need to know applicable standards for planning engineering or implementing interoperability solutions. Applications will concern but are not limited to automated collaborative environments. The book should also serve as a reference document for students and academia at undergraduate and graduate levels or in engineering schools as well as for researchers practitioners consultants and engineers faced with interoperability problems.

**Applied Information Science, Engineering and Technology** Gabriella Bognár, Tibor Tóth, 2013-09-30. The objective of the book is to give a selection from the papers which summarize several important results obtained within the framework of the József Hatvany Doctoral School operating at the University of Miskolc, Hungary. In accordance with the three main research areas of the Doctoral School established for Information Science, Engineering, and Technology, the papers can be classified into three groups. They are as follows: 1. Applied Computational Science; 2. Production Information Engineering (IT for Manufacturing); 3. Material Stream Systems and IT for Logistics. As regards the first area, some papers deal with special issues of algorithms, theory, and its applications with computing algorithms for engineering tasks as well as certain issues of database systems and knowledge-intensive systems. Related to the second research area, the focus is on Production Information Engineering with special regard to discrete production processes. In the second research area, the papers show some new integrated systems suitable for optimizing discrete production processes in a top-down way. The papers connecting with the third research field deal with different issues of materials stream systems and logistics, taking into consideration applied mathematical models and IT tools. The book makes an effort to ensure a certain equilibrium between theory and practice and to show some new approach both from the theoretical modelling aspect as well as the experimental and practical point of view.
