Yield Curves and Forward Curves for Diffusion Models of Short Rates Gennady A. Medvedev, 2019-05-18 This book is dedicated to the study of the term structures of the yields of zero coupon bonds The methods it describes differ from those usually found in the literature in that the time variable is not the term to maturity but the interest rate duration or another convenient non linear transformation of terms This makes it possible to consider yield curves not only for a limited interval of term values but also for the entire positive semiaxis of terms The main focus is the comparative analysis of yield curves and forward curves and the analytical study of their features Generalizations of yield term structures are studied where the dimension of the state space of the financial market is increased In cases where the analytical approach is too cumbersome or impossible numerical techniques are used This book will be of interest to financial analysts financial market researchers graduate students and PhD students

Risk-free rate dynamics Michel van der Wel, 2008 **Macrofinance Model of the Czech Economy** International Monetary Fund, 2012-03-01 The paper develops a VAR macrofinance model of the Czech economy. It shows that yield misalignments from the yields implied by the macrofinance model partially determine subsequent yield changes over three to nine months. These yield misalignments tend to persist for a number of months. This persistence of the misalignments was explained by a) the fact that the macro economy influences asset markets only at lower frequencies b) the liquidity effect particularly during the times of capital inflows to Czech Republic and c) the fact that not all misalignments were greater than their historical one standard deviation.

of the human population 5 6 Indices are needed that will measure sustainability through time and over space at several scales These indices must also have the ability to aggregate the many disciplinary facets of sustainability often incorporated through a large number of environmental social and economic variables Such a multidisciplinary dynamic system can be regarded as sustainable if it maintains a desirable steady state or regime including fluctuations that are desirable such as those that respond to natural disturbances 8
