Advanced Modelling Techniques in Structural Design Feng Fu, 2015-06-15 The successful design and construction of iconic new buildings relies on a range of advanced technologies in particular on advanced modelling techniques In response to the increasingly complex buildings demanded by clients and architects structural engineers have developed a range of sophisticated modelling software to carry out the necessary structural analysis and design work Advanced Modelling Techniques in Structural Design introduces numerical analysis methods to both students and design practitioners It illustrates the modelling techniques used to solve structural design problems covering most of the issues that an engineer might face including lateral stability design of tall buildings earthquake progressive collapse fire blast and vibration analysis non linear geometric analysis and buckling analysis Resolution of these design problems are demonstrated using a range of prestigious projects around the world including the Buji Khalifa Willis Towers Taipei 101 the Gherkin Millennium Bridge Millau viaduct and the Forth Bridge illustrating the practical steps required to begin a modelling exercise and showing how to select appropriate software tools to address specific design problems Computational Design Rongrong Yu, Ning Gu, Michael J. Ostwald, 2021-07-25 New computational design tools have evolved rapidly and been increasingly applied in the field of design in recent years complimenting and even replacing the traditional design media and approaches Design as both the process and product are changing due to the emergence and adoption of these new technologies Understanding and assessing the impact of these new computational design environments on design and designers is important for advancing design in the contemporary context Do these new computational environments support or hinder design creativity How do those tools facilitate designers thinking Such knowledge is also important for the future development of design technologies Research shows that design is never a mysterious non understandable process for example one general view is that design process shares a common analysis synthesis evaluation model during which designers interact between design problem and solution spaces Understanding designers thinking in different environments is the key to design research education and practice This book focuses on emerging computational design environments whose impact on design and designers have not been comprehensively and systematically studied It comprises three parts The history and recent developments of computational design technologies are introduced in Part I The main categories of technologies cover from computer aided drafting and modelling tools to visual programming and scripting tools for algorithmic design to advanced interfaces and platforms for interactions between designers between designers and computers and between the virtual environment and the physical reality To critically explore design thinking especially in these new computational design environments formal approaches to studying design thinking and design cognition are introduced and compared in Part II drawing on literature and studies from the 70s to the current era Part III concludes the book by exploring the impact of different computational design technologies on design and designers using a series of case studies conducted by the author team building on their

close collaboration over the past five years The book offers new insights into designers thinking in the rapidly evolving computational design environments which have not been critically and systematically studied and reported in the current literature The book is meant for design researchers educators and students professional practitioners and consultants as well as people who are interested in computational design in general *AI-Based Optimized Design of Structural Frames*

Won-Keel Hong,2024-10-16 This book introduces an auto design based optimization for building frames using an artificial neural network ANN based Lagrange method and novel genetic algorithm GA The work of great mathematician Joseph Louis Lagrange and ANNs are merged to identify parameters that optimize structural frames of reinforced concrete prestressed concrete and steel frames subject to one or more design constraints New features for enhancing conventional GA are also demonstrated to optimize structural frames New features for optimizing multiple design targets of the building frames are highlighted while design requirements imposed by codes are automatically satisfied Chapters provide readers with an understanding of how both ANN based and novel GA based structural optimization can be implemented in holistically optimizing designated design targets for building structural frames guiding readers toward more rational designs that is consistent with American Institute of Steel Construction AISC and American Concrete Institute ACI standards ANN based holistic designs of multi story frames in general and reinforced concrete prestressed concrete and steel frames in particular are introduced This book suits structural engineers architects and graduate students in the field of building frame designs and is heavily illustrated with color figures and tables *NEHRP Recommended Provisions: Design Examples* , **Basic**
