

$$\begin{aligned}\sigma_{1,2} &= \frac{1}{2} \left[(45.7597) \pm \sqrt{(45.7597)^2 + 4(40.74)^2} \right] \quad \left\{ \because \sigma_x = 0 \right\} \\ &= \frac{1}{2} \left[86.7593 \pm \sqrt{(86.7593)^2 + 4(40.74)^2} \right] \\ &= \frac{1}{2} \left[86.7593 \pm \sqrt{12366.87} \right]\end{aligned}$$

$$\sigma_{1,2} = 87.63 \text{ N/mm}^2 \quad \text{Ans.} \quad \text{vii}$$

Maximum principal stress at J (Using the same formula)

$$\sigma_{1,2} = \frac{1}{2} \left[(-21.4797) \pm \sqrt{(-21.4797)^2 + 4(40.74)^2} \right]$$

$$\sigma_{1,2} = 21.99 \text{ N/mm}^2 \quad \text{Ans.} \quad \text{viii}$$

Result:

Maximum normal (Principal) stress at top face = 87.63 N/mm²

Maximum normal (Principal) stress at bottom face = 21.99 N/mm²

1.9. ECCENTRIC LOADING

In a more general case of axially loaded bars the load may act at an eccentricity from the center of gravity of the member (Fig. 1.20 (a)). If we want to "bring" the load of axis of center of gravity, we can use the principle of equivalent force-couple. The couple produced by the load P is $P \times e$, where e is the eccentricity. Now this couple and the force P , acting together in the center of gravity will be equivalent to the original eccentric loading. (Fig. 1.20 (b)).

(a) Original eccentric loading

(b) Equivalent loading

Fig. 1.20. Eccentric loading of bars

Due to this, there are two types of stresses produced

1. Direct stress σ_x (Tensile or compressive)

In the case shown it is compressive, refer Fig. 1.21.

Fig. 1.21. Direct stress due to the load

This is given by $\sigma_x = \frac{\text{Force}}{\text{cross sectional area}}$

$$\text{i.e. } \sigma_x = \frac{P}{A}$$

2. Bending stress σ_y

This is due to the moment ($P \times e$). This results in different types of stresses on either side of the neutral axis of the section (Fig. 1.22), compressive on one side and tensile on the other. This stress is given as

$$\sigma_y = \frac{M \cdot y}{I}$$

Fig. 1.22. Bending stress distribution

Fig. 1.23. Total stress distribution

Total Stress

The total stress on either side of the neutral axis is the algebraic sum of the two stresses is σ_z

i.e.

$$\text{i.e. } \sigma_z = \sigma_x + \sigma_y$$

Design of Flexible Production Systems Tullio Tolio, 2008-12-11 In the last decade the production of mechanical components to be assembled in final products produced in high volumes e g cars mopeds industrial vehicles etc has undergone deep changes due to the overall modifications in the way companies compete Companies must consider competitive factors such as short lead times tight product tolerances frequent market changes and cost reduction Anyway companies often have to define production objectives as trade offs among these critical factors since it can be difficult to improve all of them Even if system flexibility is often considered a fundamental requirement for firms it is not always a desirable characteristic of a system because it requires relevant investment cost which can jeopardize the profitability of the firm Dedicated systems are not able to adapt to changes of the product characteristics while flexible systems offer more flexibility than what is needed thus increasing investment and operative costs Production contexts characterized by mid to high demand volume of well identified families of products in continuous evolution do not require the highest level of flexibility therefore manufacturing system flexibility must be rationalized and it is necessary to find out the best trade off between productivity and flexibility by designing manufacturing systems endowed with the right level of flexibility required by the production problem This new class of production systems can be named Focused Flexibility Manufacturing Systems FFMSs The flexibility degree in FFMSs is related to their ability to cope with volume mix and technological changes and it must take into account both present and future changes The required level of system flexibility impacts on the architecture of the system and the explicit design of flexibility often leads to hybrid systems i e automated integrated systems in which parts can be processed by both general purpose and dedicated machines This is a key issue of FFMSs and results from the matching of flexibility and productivity that respectively characterize FMSs and Dedicated Manufacturing Systems DMSs The market share of the EU in the machine tool sector is 44% the introduction of focused flexibility would be particularly important for machine tool builders whose competitive advantage is based on the ability of customizing their systems on the basis of needs of their customers In fact even if current production contexts frequently present situations which would fit well with the FFMS approach tradition and know how of machine tool builders play a crucial role Firms often agree with the focused flexibility vision nevertheless they decide not to pay the risk and efforts related to the design of this new system architecture This is due also to the lack of well structured design approaches which can help machine tool builders to

configure innovative systems Therefore the FFMS topic is studied through the book chapters following a shared mission To define methodologies and tools to design production systems with a minimum level of flexibility needed to face during their lifecycle the product and process evolution both in the technological and demand aspects The goal is to find out the optimal trade off between flexibility and productivity The book framework follows the architecture which has been developed to address the FFMS Design problem This architecture is both broad and detailed since it pays attention to all the relevant levels in a firm hierarchy which are involved in the system design Moreover the architecture is innovative because it models both the point of view of the machine tool builder and the point of view of the system user The architecture starts analyzing Manufacturing Strategy issues and generating the possible demand scenario to be faced Technological aspects play a key role while solving process plan problems for the products in the part family Strategic and technological data becomes input when a machine tool builder performs system configuration The resulting system configurations are possible solutions that a system user considers when planning its system capacity All the steps of the architecture are deeply studied developing methods and tools to address each subproblem Particular attention is paid to the methodologies adopted to face the different subproblems mathematical programming stochastic programming simulation techniques and inverse kinematics have been used The whole architecture provides a general approach to implement the right degree of flexibility and it allows to study how different aspects and decisions taken in a firm impact on each other The work presented in the book is innovative because it gives links among different research fields such as Manufacturing Strategy Process Plan System Design Capacity Planning and Performance Evaluation moreover it helps to formalize and rationalize a critical area such as manufacturing system flexibility The addressed problem is relevant at an academic level but also at an industrial level A great deal of industrial sectors need to address the problem of designing systems with the right degree of flexibility for instance automotive white goods electrical and electronic goods industries etc Attention to industrial issues is confirmed by empirical studies and real case analyses which are presented within the book chapters
