visual objects such as maps may fall somewhere in between the two Visual computing often involves the transformation from one type of visual objects into another type of visual objects or into the same type of visual objects to accomplish certain objectives such as information reduction object recognition and so on In visual information systems design it is also important to ask the foll ing question who performs the visual computing The answer to this question determines the approach to visual computing For instance it is possible that primarily the computer performs the visual computing and the human merely observes the results It is also possible that primarily the human performs the visual computing and the computer plays a supporting role Often the human and the computer are both involved as equal partners in visual computing and there are visual interactions Formal or informal visual languages are usually needed to facilitate such visual interactions
