Handbook of Differential Equations Daniel Zwillinger, Vladimir Dobrushkin, 2021-12-30 Through the previous three editions *Handbook of Differential Equations* has proven an invaluable reference for anyone working within the field of mathematics including academics students scientists and professional engineers The book is a compilation of methods for solving and approximating differential equations These include the most widely applicable methods for solving and approximating differential equations as well as numerous methods Topics include methods for ordinary differential equations partial differential equations stochastic differential equations and systems of such equations Included for nearly every method are The types of equations to which the method is applicable The idea behind the method The procedure for carrying out the method At least one simple example of the method Any cautions that should be exercised Notes for more advanced users The fourth edition includes corrections many supplied by readers as well as many new methods and techniques These new and corrected entries make necessary improvements in this edition Fluid Flow in Fractured Porous Media Richeng Liu, Yujing Jiang, 2019-09-30 The fluid flow in fracture porous media plays a significant role in the assessment of deep underground reservoirs such as through CO₂ sequestration enhanced oil recovery and geothermal energy development Many methods have been employed from laboratory experimentation to theoretical analysis and numerical simulations and allowed for many useful conclusions This Special Issue aims to report on the current advances related to this topic This collection of 58 papers represents a wide variety of topics including on granite permeability investigation grouting coal mining roadway and concrete to name but a few We sincerely hope that the papers published in this Special Issue will be an invaluable resource for our readers **Solving Direct and Inverse Heat Conduction Problems** Jan Taler, Piotr Duda, 2010-04-16 This book is devoted to the concept of simple and inverse heat conduction problems The process of solving direct problems is based on the temperature determination when initial and boundary conditions are known while the solving of inverse problems is based on the search for boundary conditions when temperature properties are known provided that temperature is the function of time at the selected inner points of a body In the first part of the book Chaps 1-5 we have discussed theoretical basis for thermal conduction in solids motionless liquids and liquids that move in time In the second part of the book Chapters 6-26 we have discussed at great length different engineering problems which we have presented together with the proposed solutions in the form of theoretical and mathematical examples It was our intention to acquaint the reader in a step by step fashion with all the mathematical derivations and solutions to some of the more significant transient and steady state heat conduction problems with respect to both the movable and immovable heat sources and the phenomena of melting and freezing Lots of attention was paid to non linear problems The methods for solving heat conduction problems i.e. the exact and approximate analytical methods and numerical methods such as the finite difference method the finite volume method the finite element method and the boundary element method are discussed in great detail Aside from algorithms
