Fundamentals of Electronic Imaging Systems William F. Schreiber, 2012-12-06 Image processing is a fascinating applications area not a fundamental science of sufficient generality to warrant studying it for its own sake In this area there are many opportunities to apply art and experience as well as knowledge from a number of sciences and engineering disciplines to the creation of products and processes for which society has an expressed need Without this need work in the field would be sterile but with it image processing can readily provide the interested scientist or engineer with a professional lifetime of challenging problems and corresponding rewards This point of view motivates this book and has influenced the selection and treatment of topics I have not attempted to 1 be encyclopedic this service has already been performed by others It will be noted that the word digital is not in the title of this book While much of present day image processing is implemented digitally this work is not intended for those who think of image processing as a branch of digital signal processing except perhaps to try to change their minds Image gathering and image display vital parts of the field with strong effects on image quality are inherently analog as are all of the channels and media now used or likely to be used in the future to record TV signals and to transmit them to the home

Mather, Magaly Koch, 2022-04-06 Computer Processing of Remotely Sensed Images A thorough introduction to computer processing of remotely sensed images processing methods and applications Remote sensing is a crucial form of measurement that allows for the gauging of an object or space without direct physical contact allowing for the assessment and recording of a target under conditions which would normally render access difficult or impossible This is done through the analysis and interpretation of electromagnetic radiation EMR that is reflected or emitted by an object surveyed and recorded by an observer or instrument that is not in contact with the target This methodology is particularly of importance in Earth observation by remote sensing wherein airborne or satellite borne instruments of EMR provide data on the planet s land seas ice and atmosphere This permits scientists to establish relationships between the measurements and the nature and distribution of phenomena on the Earth s surface or within the atmosphere Still relying on a visual and conceptual approach to the material the fifth edition of this successful textbook provides students with methods of computer processing of remotely sensed data and introduces them to environmental applications which make use of remotely sensed images The new edition s content has been rearranged to be more clearly focused on image processing methods and applications in remote sensing with new examples including material on the Copernicus missions microsatellites and recently launched SAR satellites as well as time series analysis methods The fifth edition of Computer Processing of Remotely Sensed Images also contains A cohesive presentation of the fundamental components of Earth observation remote sensing that is easy to understand and highly digestible Largely non technical language providing insights into more advanced topics that may be too difficult for a non mathematician to understand Illustrations and example boxes throughout the book to illustrate concepts as well as revised examples that reflect the latest information References and links to the most up to date online and open access sources used by students Computer Processing of Remotely Sensed Images is a highly insightful textbook for advanced undergraduates and postgraduate

Optical and Digital Image Processing Gabriel Cristobal, Peter Schelkens, Hugo Thienpont, 2013-02-12 In recent years Moore's law has fostered the steady growth of the field of digital image processing though the computational complexity remains a problem for most of the digital image processing applications In parallel the research domain of optical image processing has matured potentially bypassing the problems digital approaches were suffering and bringing new applications The advancement of technology calls for applications and knowledge at the intersection of both areas but there is a clear knowledge gap between the digital signal processing and the optical processing communities This book covers the fundamental basis of the optical and image processing techniques by integrating contributions from both optical and digital research communities to solve current application bottlenecks and give rise to new applications and solutions Besides focusing on joint research it also aims at disseminating the knowledge existing in both domains Applications covered include image restoration medical imaging surveillance holography etc a very good book that deserves to be on the bookshelf of a serious student or scientist working in these areas Source Optics and Photonics News
